This volume is published by the Yale University Press on the Alexander Kohut Memorial Publication Fund. This Foundation was established October 13, 1915, by a gift to Yale University from members of his family for the purpose of enabling scholars to publish texts and monographs in the Semitic field of research.

The Reverend Alexander Kohut, Ph.D. (Leipzig), a distinguished Oriental scholar, in whose memory the fund has been established, was born in Hungary, April 22, 1842, of a noted family of rabbis. When pastor of the Congregation Ahavath Chesed in New York City, he became one of the founders of the Jewish Theological Seminary, and was a professor in that institution until his death. He was a noted pulpit orator, able to discourse with equal mastery in three languages. Among his contributions to Semitic learning is the monumental work Aruch Completum, an encyclopaedic dictionary of the Talmud, in eight volumes. Semitic and Oriental scholars have honored his memory by inscribing to him a volume of Semitic Studies (Berlin, 1897).
TO

GEORGE A. BARTON, Ph.D., LL.D.

MY ESTEEMED COLLEAGUE AND FRIEND
PREFACE

Sayce and Wright about forty years ago brought to the attention of those interested in Ancient History the forgotten empire of the Hittites. The study of the inscriptions of Egypt and Babylonia in the decades which preceded had made this possible by furnishing allusions to this people who came to the fore about 2000 B. C. Another nearly forgotten empire which exerted a powerful influence upon the surrounding nations, namely the Amorite, is also brought to light through similar investigations of the last few decades, largely in the cuneiform literature; but this empire belonged to the period just prior to the ascendancy of the Hittites.

In *Amurru, the Home of the Northern Semites*, a study showing that the religion and culture of Israel are not of Babylonian origin, the thesis was advanced that the culture of the Semitic Babylonians had, if not its origin, at least a long development in the land of the Amorites before it was carried into Babylonia; and that the religion and culture of Israel were not importations from Babylonia, but developed naturally in their own land from an earlier and indigenous civilization.

As is well known, there appeared in Germany about a score of years ago a vigorous school of critics generally known as the Pan-Babylonian or Astral-mythological School, which maintained that Babylonia had furnished the Hebrews with most of their religious ideas, including monotheism; in fact, the members of this school held that the civilization of Israel generally had its origin in Babylonia. Winckler, the founder of the school, endeavored to show that the patriarchs and other leaders of Israel, as Joshua, Gideon, Saul, David, etc., were solar or lunar deities of the Babylonians. Delitzsch called Canaan at the time of the exodus a domain of Babylonian culture. Gunkel held that Israel's religion had assimilated actively this Babylonian material, and when it had become relaxed in strength, it swallowed the foreign elements, feathers and all. Zimmern found that elements of the Marduk cult were applied to Christ; even his death was suggested by that of Marduk and Tammuz. But the most extreme of all was Jensen, who found
that all the biblical characters, from Abram to Christ, even including John the Baptist, were simply borrowed from Babylonian sun-myths.

In popularizing these theories, as well as others not so far-reaching, that arose in Germany, certain American and English scholars resorted to all kinds of efforts to pare them down so as to make them more palatable: by making the borrowings early instead of late, proposing that when Israel entered Palestine they were part of the mental possession of the people; or by making it appear that these Babylonian myths were simply used in a devotional way to illustrate ethical implications, or as media for the expression of a more spiritual faith. In many quarters, scholars gravitated toward this theory; and it was conceded generally that there was a considerable dependence upon Babylonia. Reflections of these revolutionary ideas flared up almost everywhere.

The purpose of the study Amurru was to examine the data upon which the theories rested; the results were such that it could be asserted that Israel did not adopt the civilization of the Babyloni-ans and that they were not the purveyors of borrowed religious ideas and myths from Babylonia. The study of the cultural elements of both lands did not show such Babylonian influence, for apart from the use of the Babylonian language and syllabary in the West, the evidence from the Neolithic to the Greek period is wanting. To cite a single test, Ellil was the name of the chief god of Babylonia until Marduk supplanted him. Nergal was also a well known Babylonian deity. The thesis Amurru maintained that these were names of Amorite deities which had arisen in Babylonia largely because of the form in which they had been written: En-lil, Amar-Utug, and Ne-Uru-Gal. Even though this proves incorrect, if Babylonia furnished the West with its religion and culture, where is the influence of these deities seen? The single use of the ideogram Ne-Uru-Gal on the Ta'anach seal proves nothing, for it doubtless reproduces the name of an Amorite god. But where in the West do we find the pronunciation of Ellil, Marduk, Nergal,¹ which we know was actually used in Babylonia?

¹ Post-exilic names like Mordecai of course cannot be considered; nor "the priest of Nergal" mentioned in a Phoenician inscription of the third century B. C.
The thesis was presented not only to demonstrate that the Pan-Babylonists’ claims must be abandoned, but also to show that the elements from which the Semitic Babylonian religion had largely evolved had their origin in the West land, or in the land of Amurru; and that, instead of the Hebrew culture being imported from Babylonia, it had grown up and developed naturally from older and indigenous civilizations which had come down from generations reaching far back into the ages. To make this appear reasonable, it became necessary to show that there was an antiquity for the civilization of this Semitic land which had been hitherto unrecognized.

It was fully expected that out of the mass of details offered in substantiation of the thesis, certain reviewers would seize upon such as would be readily recognized as doubtful by the casual reader. Mingled with the hundreds of facts presented in Amurru, there are many comparisons and suggested identifications set forth, that the unbiased investigator recognized were not “put on the same level.” For as one scholar wrote: “It is sufficient merit to have opened up new vistas of the ancient culture of the Northern and Western Semites; and even if some of the points emphasized, perhaps unduly, should not turn out to be supports for the theories, enough and more than enough remains to substantiate the main thesis that the Amorites entered Babylonia at an early period and brought the worship of certain gods and cosmological and other traditions with them, and that what we designate as Babylonian religion is the result of the mixture of these Amoritish elements with those indigenous to the Euphrates Valley.”

It was not thought for a moment that such an innovation would appeal to Winckler and his followers, abroad or in this country. It was not even contemplated that such a reactionary view would cause the casting aside of the cherished Pan-Babylonian theories by those who had adopted them as their own. And yet the publications since the appearance of the book in 1909 show that the stream of Pan-Babylonian literature suddenly changed from a torrent to an almost insignificant rivulet.

Most gratifying has been the number of those who, by review or comment in various publications, or by correspondence, have

accepted the new point of view; and even of those who, though unable to see their way clear to reverse completely their position, have realized that the cumulative proof presented is evidence of a character that requires serious consideration.

The work *Amurru* was in no sense meant as an apologetic effort in the interests of the traditional view of the Old Testament. It was not intended to minimize the fact that the biblical writers brought the current myths or legends, with which they were acquainted, into accord with their advanced monotheistic conception of the government of the universe. It did, however, defend vigorously the historical existence of such personages as Abraham, Moses, etc., as well as of a patriarchal period. While there was no apologetic effort intended, the conclusion which resulted tended to emphasize the reliability of the main outlines of the early history of the Hebrews and neighboring peoples as recorded in the Old Testament.

The purpose of the present contribution is to assemble all the light that bears upon the history and religion of the Amorites, especially of that early period when the empire still existed; to corroborate the great antiquity that the writer has claimed for this people in making them one of the earliest known; to show that Ur of the Chaldees was very probably the capital of the Amorite empire; incidentally to offer additional evidence in substantiation of the thesis of *Amurru*; and to demonstrate that the generally accepted theory of the Arabian origin of the Semites is utterly baseless.

It would be rash to imagine that all the multitudinous details set forth will pass the test of future searching inquiry. Inevitable alterations and difference of opinion manifestly will result from their presentation; yet it is fully expected that the main outlines will stand the test.

The writer is indebted to his colleague Prof. C. C. Torrey, to Prof. A. T. Olmstead, Doctor Ettalene M. Grice and Doctor Henry F. Lutz for valuable suggestions, and assistance rendered in connection with the manuscript and proofreading.

INTRODUCTION

The evidence of the early existence of the Amorites, as well as the proof of the futility of the Arabian theory, depends largely upon a study of names of countries, cities, temples, deities, and persons. An occasional historical reference is found which throws welcome light upon the subject, as for example, the origin of the founder of a dynasty, an allusion to the invasion of the land, or a title showing suzerainty of the country, etc. But in determining origins or influences, and even data upon which historical events are based, there is no more important evidence available at present than that furnished through the study of names.

In not a few instances, considerable depends upon even a single name; for example, it rested alone upon the resemblance of the name Humbaba of the Gilgamesh epic to the name Humba, an Elamitic god, that the belief that the cedar forest scenes of the epic were laid in Elam, instead of the Lebanon or Amanus districts, which, however, is now definitely shown is a mistake (see Chapter VIII).

There are known at present more than a hundred thousand personal names which were written upon clay tablets belonging to all periods of Babylonian history. Having the opportunity of studying such large masses of names of a particular country, it becomes possible to single out or designate with considerable accuracy what is foreign and what is not.

A large number of foreign names in Babylonian literature do not contain any known elements, which fact makes it impossible to identify their source; but thanks to our increasing knowledge of the cultural elements of certain peoples, at least those of a general character, and more exact knowledge of the civilization of others, it is quite possible to identify with considerable accuracy names on the one hand that are Babylonian or Sumerian, and on the other that are Cassite, Hittite, Mitannian, Elamitic, Persian, Hebrew, Egyptian, Arabic, Greek, etc.
Most of these nationalities can readily be determined from a knowledge of their nomenclatures; but even the nationality of names in languages of which we have little knowledge can frequently be identified. Although to start with we may be familiar with only a few names belonging to a foreign people, it nevertheless soon becomes possible to identify many scores of others as belonging to the same people. For example, we may know that Teshub was the name of a Hittite god, who was also worshipped in Mitanni. Names constituted with Teshub can therefore be tentatively set apart as Hittite, or Mitannian. The elements that are found combined with Teshub are compounded with names of other deities, which enables us to increase the list, at least tentatively. This process can be continued until a surprisingly large list of words is collected. The possibility of error in thus assembling and determining foreign names, as well as words, belonging to peoples of whose language we have little or perhaps no knowledge, is recognized; but nevertheless, although such lists of foreign names suffer modification, the method leads to permanent results.

The foreign names found on tablets from Babylonia represent the peoples that came in contact with those who lived in the valley of the Tigris and Euphrates. In some instances only isolated examples occur, and again masses of names, belonging to a particular people. In many instances such influx of foreigners is caused by migrations or conquests; a foreign nation has invaded the land; or these alien names represent peoples who were brought captive into the land, or who settled in it. These foreign names, considered in connection with the personal names of rulers, make it possible in some instances to reconstruct considerable history with little additional data. For example, in the time of Manish-tusu, many Amorite names occur. The names of the rulers of the Nīsin, Larsa, and Babylon dynasties, which were contemporaneous, as well as the thousands of foreign Amorite names in the legal and epistolary literature of the latter part of the third millennium B. C., show the same influence. The names of the rulers of the Cassite period bear Cassite names, and the documents of this time contain many of the same character, and also Hittite-Mitannian names. Hebrew names abound in the Assyrian inscriptions, after Israel had been carried into captivity. The same is true in the
Neo-Babylonian period after Judah had been carried into captivity. In the Persian period, besides Hebrew names, many Persian and some Egyptian names occur, the latter apparently due to the rule of the Persian kings in Egypt. And as was to be expected, in the Greek period, Greek names are found. Besides the large masses of foreign names, smaller groups in the various periods can in many instances be accounted for. Even the absence of such foreign names in certain periods furnishes very important data in deciding questions bearing on invasions, migrations, influence, etc. In brief, the study of names, together with isolated historical facts gathered from the records of contemporaneous peoples, has made it possible to create at least the outlines of the history of certain ancient nations.

A complete treatise on the political history and religion of the land Amurru would embrace all our knowledge of Hebrew history and religion, the early legends and primitive religions of Palestine referred to in the Old Testament, the history and religion touched upon in the Amoraic and Aramaic inscriptions of the first millennium B. C., as well as in the later Greek and Roman sources. It is the purpose of the present study, however, to emphasize especially the material belonging to the history of the early period, when the Amorite empire existed. Incidental references are made, however, to certain facts belonging to the later period, from Egyptian and Biblical sources, which throw light upon questions belonging to the early period.

We are here interested chiefly in the Amorites of the third, fourth, and fifth millenniums B. C., when the great empire of the Amorites existed, although the prevailing view is that the Semites of Amurru came out of Arabia as barbarians in the latter part of the third millennium B. C., and later. True, the knowledge we have of their early history is little more than a glimmer here and there, obtained from the records of Babylonia and Egypt, except as we feel the pulse of this people by contact with offshoots that appear in the surrounding lands. It is upon these data that we must largely rely at present; namely, the influence exerted by the Amorites upon peoples with whom they came in contact through their encroachments upon, and invasions of other lands.

The existence of an Amorite civilization as early as the Baby-
Ionian, as well as the inference that Amurru furnished Babylonia with its Semitic inhabitants, as noted, are dependent largely upon the Sumerian and Akkadian inscriptions. Unfortunately at the very beginning of our investigation we are confronted with the difficulty of differentiating between what is Sumerian and what is Semitic.

The fact that a name or a religious idea appears in the Sumerian language does not necessarily imply that it is Sumerian. Much that has been credited to the Sumerians has already proved to be Semitic. The idea of the ziggurat, for example, being a high place, upon which the gods were worshipped, is generally regarded as a Sumerian idea. This seems to be almost entirely due to the fact that the towers bear Sumerian names, as well as the temples with which they are connected. But this is the case even in centres, as far as is known, that have always been Semitic. It is largely because of these names that the Sumerians are regarded as having come from a mountainous district.

We know of a certainty that in all early periods of which we have knowledge, the Semite as well as the Sumerian used the language of the latter. Even in comparatively late periods Sumerian was used for legal purposes; and up to the very latest, as the liturgical language. It was used frequently also for monumental purposes in all periods. Lugal-zaggisi used both languages on his monuments (cf. BE I, 87, and UMBS V, 34). The same is true of Sargon (UMBS V, 34, etc.), and kings of the Nisin, Larsa, and Babylon dynasties.

Long ago it was argued that Lugal-zaggisi was a Semite, when only his Sumerian inscription was known (BE I, 266-268). It was also maintained that names like Ur-Ninâ (Kalbi-Ninâ), A-Kur-Gal (Apil-Uru), Dun-gi (Bau-ukîn, or perhaps Dun-Gir "the Hero of Gir"), etc., were Semitic, but that they appeared in a Sumerian garb. Naturally it is possible to transpose most of the Sumerian names into Semitic, because the ancient Oriental and other names had much in common in construction and in meaning, even if not linguistically.

While unfortunately it cannot be proved to what extent this was actually done, the custom can be shown to have been practiced.
For example, in the period of the Larsa dynasty, the golden era of Babylonian history, we know of Semitic names of places which were written phonetically, giving us the exact pronunciation of these names, that were also written in Sumerian; and in some cases the elements are transposed, for example, Ishkun-Nergal, the Semitic name of a city in the fourteenth year of Rim-Sin, is also written in Sumerian, Nergal-gar-ra.1 Also because of other considerations it is very often difficult to know from the form in which the personal name appears, whether we have to do with an Akkadian (i. e. Semitic) or a Sumerian.

But this is not without a parallel even in the present time. A Japanese name written ideographically can be also pronounced in Chinese, which would be quite different from Japanese; and in fact unless the name is known to be one or the other, in many instances, it cannot be determined. With the knowledge, therefore, that a centre was Semitic, and also that the dynasty was Semitic, we have reason to infer that many of the personal names, even though written in Sumerian, were actually Semitic. The same is true of the names of temples, ziggurats, and deities. Ne-Uru-Gal, "Nergal," is the name of a deity in a Sumerian garb, but we know the deity was Semitic.

The names of the temples of every city, Akkadian as well as Sumerian, appear with Sumerian names in the inscriptions. This is true even in Amorite lands, for example, the temples at Aleppo, Harran, Tirqa, etc., bore Sumerian names. It is impossible to explain this at the present time in any other way than that it was due to the fact that the Semites had used the language and script of the Sumerians at a very early time, of course, prior to our earliest records. From this we get the impression that we are far from the point of having clear ideas as to where and when the Semites first used the Sumerian cuneiform for their language.

Naturally, these are problems which can only approach solution after more is known about the written language of the Semitic peoples other than the Semitic Babylonian, from whom the latter came. At present, absolutely nothing is known of any Semitic script except the Babylonian, prior to the earliest known Phoe-

1 See Grice, Chronology of the Larsa Dynasty, YOR IV 1.
nician and Aramaic alphabetic writing, and this is dated from about 1000 B.C. Semites in Cappadocia already used in the third millennium B.C. what we have been regarding as the Babylonian language and script. A few tablets found in middle Mesopotamia indicate that in the early part of the second millennium the Babylonian script was used there. And of course the Amarna letters and the Hittite tablets show that the language and script were used throughout the land in the latter half of the second millennium B.C., not only for Semitic tongues but non-Semitic as well.

These and other considerations make us conclude that many of the problems involved are far from solution at the present time. We may ultimately find that the Semites had adopted their system of cuneiform writing before they settled in the valley; or that they did not have a written language for a period after they entered the valley, until the Sumerians invaded and became masters of the land; or we may find that the Semites, bringing with them their culture, invaded the land already occupied by the Sumerians, upon whom, however, they were dependent for their written language, and from which contact their own system of writing evolved. The Sumerian being the parent script and perhaps for a time the only one used by the Semitic Babylonians, it is not difficult to understand how its use was very much more extensive in the early period than the script which had evolved from it.

While these questions cannot be solved, the writer, in view of the increased light upon the situation covering investigations of a series of years, inclines more and more to the view that the Semitic elements that have been absorbed in the culture we regard as Babylonian, are much more numerous than is usually recognized; and, moreover, that although the names of temples, gods and individuals appear in a Sumerian garb, this is no proof that they are not Semitic.

Zimmern in his *Busspsalmen* admitted that the penitential psalms may represent translations from the Semitic Babylonian into Sumerian, and that there were no certain criteria for determining whether a text was of Sumerian or Babylonian origin. Prince in his *Materials for a Sumerian Lexicon* also takes the position that many of the Sumerian texts are really "translations of
I. INTRODUCTION.

Semitic ideas by Semitic priests into the formal religious Sumerean language." The late American scholar, Rudolph Brünnnow, in letters published some years ago by Halevy (RA 18, 259 ff.), took the position that all the so-called bilingual texts revert to Babylonian originals. He inclined to the view that the Semites were the original inhabitants of the valley, and that the Sumerians, on entering, largely adopted the civilization they found in the land. He did not maintain that the origin of the civilization was Semitic, but that it was a product due to the amalgamation of these two races, in which the Semitic element predominated, and eventually gained supremacy.

The thought expressed by these writers, that much of the Sumero-Akkadian literature that has been handed down is Semitic and not Sumerian, seems perfectly reasonable in the light of all that is known. Even as regards the religious texts the knowledge that the writing was confined to the scribe or priest, makes it reasonable to infer that the formulae which were intended to invoke the deities or charm the spirits would be couched in a form more or less unintelligible to the pious Semitic applicant. The religious and intellectual leaders were in this way able to awe their clients and keep them dependent upon them by using a language that was unintelligible.

Eduard Meyer is also of the opinion that the Semites occupied the land prior to the entrance of the Sumerians, who, he holds, settled in southern Babylonia, drove the Semites northward, and occupied their old cult centres. He bases his argument on the fact that the monuments show that the Sumerians represented their gods with abundant hair and long beards, while they themselves shaved their heads and faces; also that the garments they represent their gods as wearing are different from those of the people. Since gods are usually depicted wearing the same costume as man, it must follow that the image of the gods, as regards their hair and dress, must have been according to the pattern shown them by their predecessors, whom Meyer thinks were the Semites. To be consistent, Meyer would have to admit that the primitive and uncultured Semite must have dressed well; and that the Sumerian, who had the genius for art, was dependent upon him at least for these
marks of his civilization. This reminds us of the well-dressed Amorites, whom the Egyptian artist depicted in the tomb of Beni-Hassan (see Chapter XIV).

The question as to whether the Semites or the Sumerians first occupied the land of Babylonia, is here irrelevant. Suffice it to know that in the earliest history known, we find both present in Sumer as well as in Akkad.

In this connection, it seems fitting to discuss briefly the keeping distinct or differentiating between what is Akkadian or Semitic Babylonian and what is West Semitic. In answer to the criticism of Böhl, who takes issue with the thesis presented in Amurru on the ground that it does not keep separate these elements, which difference the Babylonians themselves, as early as the time of Hammurabi, clearly recognized, it is only necessary to rehearse what is clearly set forth in Amurru the Home of the Northern Semites.

The title of this thesis implies that the home of the Semites who are regarded as the northern branch of the Semitic family, is in the lands west of Babylonia; that the people from this region migrated to the Euphrates valley, and in time were called Akkadians; that periodically, after the civilization of the earliest invaders, influenced by the Sumerians, had been developed into what is peculiarly known as Akkadian, there were invasions or migrations during the succeeding millenniums that brought additional people from the same region into the valley. We are dealing with millennia. The civilization under these conditions, after a century or two, would be sufficiently removed from what it was originally, so that the people who came afresh from the old centres would be recognized as foreign. The distinction, naturally, would be more pronounced in centres where Sumerian influences were greater.

Each Babylonian city, as we know, represented a principality, and each had its temple and school of scribes which was distinct from other schools. The different appellations of the same sun-deity of the Semites can only be accounted for in this way. The hundreds of names of deities written in Sumerian show that as a rule it was customary to write them ideographically, and that the

*Kanaanäer und Hebräer*, p. 39.
ideograms selected were often descriptive of the god’s attributes; as for example, \( \text{\textit{En-lil}} \), “Lord of the storm”; \( \text{\textit{En-amas}} \), “Lord of the fold”; or, as indicative of the god’s origin, \( \text{\textit{En-Din-tir}} \), “Lord of Babylon.” It can scarcely be thought possible that all the gods’ names in Sumerian were in common usage pronounced as written, for example: \( \text{\textit{Nin-a-dam-azag-ga}} \), \( \text{\textit{Nin-igi-zi-bar-ra}} \), \( \text{\textit{Umnun-bad-urudu-nagar-ki}} \), etc. Other ideographically written names of deities, however, even though originally not intended to be pronounced as such, for example, \( \text{\textit{Ne-Uru-gal}} \), perhaps “light of the great Uru,” \( \text{\textit{Amar-Utug}} \), a syncretistic formation, \( \text{\textit{En-lil}} \), “lord of the storm,” \( \text{\textit{Nin-gal}} \), “great lady,” etc., in time were called or pronounced Nergal, Marduk, Ellil, and Nikkal respectively. The actual name of the deity En-lil, however, may have been Adad, Shara, Ura, or some other name of the storm-deity. In other words, the ideogram itself in some instances was pronounced and came into use, and even displaced the original name of the deity.

It is understood that \( \text{\textit{Nin-Gir-Su}} \), Lady of Girsu, at Telloh, was a deity similar if not identical with \( \text{\textit{Nin-IB}} \) at Nippur. The name of the latter we now know was pronounced Inurta or Inmashtu in the late period (see Chapter XVII). It would not be surprising to learn that \( \text{\textit{Nin-Gir-Su}} \) originally was simply another ideogram used at Telloh for the same name Urta or Inurta. Doubtless, the ideogram \( \text{\textit{Nin-Mar}} \) and many others were originally the same.

At Umma the name of the deity Shara was perhaps without any exception written in that city with the sign \( Lagab \) with \( igi-gunu \), inserted, and yet there are reasons for holding the view that Shara was a very common name or element found in the appellations of deities and temples, not only in Babylonia but in Amurru (see Chapter XVII, and MI p. 14). While most of the several thousand names of Babylonian deities appear in Sumerian dress, from the few whose actual pronunciation we now know we have reason for believing that the origin of a very large number of the ideographically written names in Sumerian was Semitic.

As an illustration, let us think of the original Semites entering Babylonia from Amurru with their deity ‘Amor (‘Amur= ‘Aeur= ‘Uru). In a thousand years, under circumstances referred to above, not only could the name have suffered modifications, but
the conception of the deity as well. Even in Amurru, during the thousand years under different influence, the conception of the deity as well as the pronunciation of its name may have suffered modification, so that there would be quite a gap between this cult of the peoples living in Babylonia and the newcomers. In other words, we must look upon the Semites, who had originally entered Babylonia from the wide area of Amurru, as having modified under other influences their religious conceptions. Different names for their storm-deity had in the meanwhile arisen in the different centres occupied by Semites, which, as was said, were more or less distinct from each other and under different influences. In other words, in a thousand years, under influences of this kind, a culture would have developed quite distinct from what had previously been brought into the land. With these conditions in mind, it is quite understandable that the priests and the guild of scribes would look upon the fresh influx of Amorites as foreigners, and as possessing a cult quite distinct from their own. The same was true with reference to personal names; for example, the name Ishme-Dagan was originally Amorite, and was pronounced Jashma'-Dagan in Amurru, but it had long been Babylounized and pronounced Ishme-Dagan. When, however, fresh invasions brought men bearing the name into the country the difference in the pronunciation was noted, for the scribes wrote Jā-aš-ma'-dāgan. In other words, in a generation or so the foreign Semites were more or less Babylonized, or were absorbed completely by the Akkadians; and if there were no fresh influx, foreign names either gave way to Akkadian, or the nomenclature gradually ceased to show any distinction in the pronunciation. This is shown by a study of the names in the period of the Cassite dynasty, which followed that of the West Semitic Larsa, Nisin, and Babylon dynasties, when Amorite names abounded. In the Cassite period, owing to the inactivity of the Amorites, West Semitic names very generally disappeared. The cult of the individual family was doubtless given up for that of the land, with which it had much in common.

The distinction, therefore, as to what is West Semitic and what is Akkadian, was clearly made in Amurru (in spite of the assertion of Böhl, mentioned above), and is kept in mind throughout this discussion.
II.

THE HOME OF THE SEMITES

There are those who hold the view that the Semites and the Hamites were originally one race, and lived in Northern Africa, whence the Semites passed over into Arabia, and from there were dispersed. The view, however, that Arabia was the original home of the Semites is generally accepted by scholars. The Semites that are found in other lands surrounding Arabia are regarded simply as successive migrations of Arabs that have deposited themselves layer upon layer in those lands. The migrations, due to over-population, have recurred periodically. We are told that Arabia breeds vast numbers of its nomad tribes, but it can not support them; that a thousand years was required to fill Arabia up to the point when it could no longer sustain its inhabitants, and in consequence they migrated to adjacent lands. With slight variations this 'stock' theory has been used by a succession of writers. They tell us that the first migration of which we have knowledge brought the Semites into Babylonia. The second migration is represented by the Semitic outbursts on Palestine between 2500 to 2000 B. C., and accounts also for the Semitic invasion of Babylonia when the rulers of the First Dynasty of Babylon controlled the land; this theory, however, has recently been modified. The third periodical disgorging of Arabia is known as the "Aramaean migration," when the land again "spat out." Some hold that this migration began near the middle of the second millennium B. C., and others that they first moved out in the thirteenth century. This migration took the Aramaeans into Syria and Mesopotamia, and their kindred tribe, the Hebrews, into Palestine. The next so-called "spilling over" period, or "sporadic wave of hungry tribesmen," was from the fifth century, when the Nabataeans moved upon Petra. And the last is when Islam invaded Western Asia and parts of Europe. In nearly every work that is examined on the history of Semitic peoples, some form of these statements, making Arabia the cradle of the Semites, or making all Semitic peoples come from Arabia, is found.

(27)
One of the earliest writers to have maintained that Arabia was the primitive home of the Semites was the German scholar Sprenger who in his *Das Leben und Lehre des Mohammed* (1861, 241 ff.), and in later works, maintained that agriculturists do not become nomads, and that all Semites are Arabs. Sayce, as early as 1872, declared that the Semitic traditions all point to Arabia as the original home of the race; it is the only part of the world which has remained exclusively Semitic. The racial characteristics—intensity of faith, ferocity, exclusiveness, imagination—can best be explained by a desert origin. Schrader, De Goeje, Wright, and Meyer, were other writers who held similar views.

The periodical wave theory seems to have been originated by Winckler who in his *Geschichte Babyloniens und Assyriens* says: "The home of the Semites was Arabia, due to geographical considerations and to the fact that the purest Semites are at present found in that land. The migrations are due to over-population and recur periodically. He said, "we have definite knowledge of four main Semitic migrations northward." These are in reverse order: 1. The Arabian, which began in the seventh century A. D., and culminated in the conquest of Islam; 2. the Aramaic, from the fifteenth to the thirteenth century B. C.; 3. the Amorite, a thousand years earlier, 2400-2100 B. C., and 4. another, a thousand years earlier when Babylonia was settled by the Semites.

This thousand year disgorging theory has been adopted by many English and American writers. In Paton’s words: "Thus it appears that it took a thousand years each time to fill Arabia up to the point when it could no longer hold its inhabitants but must disgorge them upon the adjacent lands." In addition to the four migrations assumed by Winckler, Paton adds the so-called earlier Nabataean, which is placed as beginning about 500 B. C.

Barton in his *Semitic Origins* (1902) developed the Arabian theory in a more elaborate manner than previously had been done. Even though one does not agree with the position taken by Barton, he cannot help admiring his full and thorough treatment of the subject. Not only does he look upon Arabia as the cradle-land of

---

1 For the literature on the subject, see Barton. *Semitic Origins.*
2 *Early History of Syria,* p. 7, 211, etc.
the Semites, but upon North Africa as the place of the ultimate origin of the Hamito-Semitic races, which he claims are kindred. After the migration of the Semites into Arabia, some of their Hamitic brethren, who until then had been nomads, displaced the Negroïds in the valley of the Nile, learned agriculture, and formed the race of the Egyptians. His arguments for Arabia being the home of the Semites, follow: 1. Semites are now in Arabia and in contiguous lands, Babylonia, Syria, Abyssinia, etc., lands more fertile than Arabia, in which agriculture has been practised from time immemorial. 2. During the historic period, wave after wave of Arabs has been pouring from Arabia into the surrounding lands; it is probable that the migration has always been that way, and not vice versa. 3. It may be regarded as a law of social progress that nomads pass from a sterile to a fertile country, and become agriculturists; but not from a fertile to a sterile country, and change from agriculturists to nomads. It is inconceivable, if Semites originated in a land more fertile than Arabia, that they should have migrated thither. 4. The Arabic language, where the race has been protected by deserts, has preserved the characteristics of primitive Semitic speech much more fully than any other Semitic tongue. 5. The Arabs, better than other Semites, have preserved the racial characteristics of ferocity, exclusiveness, intensity of faith, and imagination.

In his review of these successive waves, Luckenbill also adopted the theory. He said the first wave from the desert of Arabia to the north took the Babylonians of the Dynasty of Sargon about 2500 B. C. into the Euphrates valley, and they were perhaps the founders of Phoenicia. The next wave brought the First or Hammurabi Dynasty into Babylonia, and the Canaanites into Canaan. The next took the Aramaeans into Syria and Mesopotamia, and their kindred tribes, the Hebrews, Amorites, Moabites and Edomites, into Palestine ca. 1500 B. C.4

3 This latter view is supported with linguistic evidence by Barton in JAOS 35 214 ff.

4 Biblical World 1910, p. 22; and AJSL 28 p. 154. It is only fair to Luckenbill to state that in an article which recently appeared (AJT 1918, p. 30) he accepts the view that the Hammurabi Dynasty is West Semitic.
Macalister is another writer who has accepted these 'stock' views as facts. He says: 'for though Arabia may breed vast numbers of its nomad tribes it cannot support them; and though the struggle for existence may be diminished artificially by the inhabitants, by means of intertribal battles and, in ancient times, of infanticide, yet a time comes periodically when necessity forces its surplus population to overrun the more fertile neighboring lands. The country, as has been noticed, comes into prominence historically every thousand years, more or less.' (Civilization in Palestine, p. 27.)

Although regarding the origin of the First Dynasty as Amorite, King nevertheless looks upon Arabia as the cradle of the Semites. He traces four great Semitic migrations. The first settled Northern Babylonia; the second, which was the Canaanite or Amorite, took place in the third millennium B.C. The third was the Aramaean in the fourteenth century, which established its kingdom in Syria with its capital at Damascus; and the fourth took place in the seventh century of our era (IB p. 125).

It would serve no purpose to multiply quotations from writers who share these views. Suffice it to repeat what is said above, that most scholars have accepted these periodical waves of emigration from Arabia as historical facts.

It is not the writer's purpose to discuss or attempt to decide between contending scientists concerning the ultimate origin and gradual formation of the Semitic race, its separation from the so-called Hamito-Semitic race, the millenniums required to develop the striking racial difference, the conditions under which Semitic characteristics developed, and all other anthropological inquiries concerning the origin of Semitic society. The writer has waded through masses of conjectures on these points, based almost entirely upon hypotheses, such as Anthropologists must largely confine themselves to, but he prefers to base his own conclusion alone upon historical or archaeological data and traditions; which of course leaves untouched the ultimate origin of this race.

Arabia is a land of great contrasts. One-half of the country is composed of sandy deserts, with wide areas of shifting sand, where water is difficult to obtain, and famine is always imminent. In
many of these parts it is only after the spring rains that the soil furnishes a meagre subsistence for the Bedouin. It should be noted, however, that there is a river system which includes the region of the wadies; but the rivers never reach the sea. These in midsummer are dry. In such sterile places, no permanent settlements can be looked for. Elsewhere, there are great and small oases. Then there are extensive fertile highlands and pastures. In the great tropical districts on the coast of the Red Sea, the Indian Ocean, the Persian Gulf, and in Southern Arabia, the land of frankincense, myrrh, coffee, spices, and perfumes, there is naturally all that is required for a great civilization. The same is true also of the mountainous districts of Arabia.

The question arises in this connection, was the climate of Arabia in ancient times the same as to-day? Hommel, who has made a careful study of the work of the explorers of Arabia, says: "It is safe to assume that in ancient times there was much more water than at present." Ellsworth Huntington maintains that great changes in the climate of Central Asia have taken place during historic times. He has shown how great tracts of territory which at one time were populated are at the present desert, or mitigated desert, which supports vegetation only part of the year. He tells us that "Syria and Northern Arabia, from three to five hundred miles south of Lake Gyoljuk, present phenomena almost identical with those of Central Asia. Mr. F. A. Norris, a member of the Princeton Expedition to that region in 1904-5, states that a large number of ruins lie in the desert in a location where to-day there is no adequate water supply, and where it would be impossible to secure sufficient water with the system of irrigation employed when the ruined cities were in their prime. Elsewhere the water which appears formerly to have supported oases is now saline. The ruins date from the beginning of the Christian Era." (The Pulse of Asia 367 f.) This change of climate, Huntington claims, has been observed to have taken place also in the Sinaitic Peninsula, and even in Egypt.

If the desert portion of Arabia in ancient times was less sterile

5 "Arabia," in Explorations in Bible Lands 694 ff.
than at present, and the wadies, which are so clearly defined in certain parts of the land, contained water for at least the greater part of the year, one can readily understand how tribes with great flocks would pass into this country even from the north. It is only necessary to take into consideration the fact that great Bedouin tribes at present occupy these sterile districts in the seasons of the year when rains, for the time being, restore fertility; after which they move to other parts where subsistence is possible.

As history has made us acquainted with the fact that in the earliest period there were permanent cities or habitations of peoples engaged in agricultural pursuits, the question as to whether the nomad preceded the agriculturist, or vice versa, belongs to the sphere of anthropology. Moreover, history and tradition make us acquainted with a great nation, including nomadic tribes in the northern regions of the Semitic world in the earliest period known; and what is still more to the point, movements of the people eastward into Babylonia, and of the nomadic tribes southward into Arabia.

The fact that the Arabic language preserves more fully the characteristics of primitive Semitic speech, it seems to the writer, as it has to others, is evidence only of the fact that Arabia was settled by Semites prior to the time when the Semitic languages with which we are familiar had suffered decay, or rather such modifications as usually follow the development of civilization. The language of Arabia, even at the present time, three thousand years later than the period to which the earliest South Arabian inscriptions belong, can be said to have retained many of the characteristics of primitive Semitic speech which the other Semitic languages had lost millenniums ago. The conditions of life in Arabia are responsible for the permanency not only of language but also customs and manners, which fact is so well understood. In the great centres along the Euphrates, in Aram, or along the Mediterranean, which were not isolated, as in Arabia, development was more rapid. As an illustration, the English language of several centuries ago is better preserved in parts of England less affected by such metropolises as London. The most primitive French spoken at the present time is not heard in Paris, but in isolated districts, which have seen the least development. It seems to the writer that the lin-
guistic argument, so frequently used in support of the theory of
the Arabian origin, needs no refutation.

In connection with the argument that exclusiveness, intensity of
faith, imagination and ferocity are all racial characteristics of the
Semites, and that Arabs have better preserved them, it need only
be said, if this is correct, that the climate and other existing condi-
tions are responsible for the pronounced character of these pecu-
liarities of the Arabs.

The argument based upon the so-called waves of migration is the
one which is so cogently pressed by the advocates of the theory,
and is fortunately the one we can fully test by history and tradition.
To do so, it is necessary to ascertain, as the first step to be taken,
what characteristic features of civilization we can take cognizance
of that are peculiar to the Arabian.

Owing to the conditions prevailing in Arabia, little more than
cursory explorations have been possible, and these have often been
conducted under most trying circumstances. Nevertheless, during
the past century there has been a rich gathering of inscriptions,
dating, as some scholars hold, from about 1000 B.C., while others
maintain even an earlier date. A great antiquity, however, for
Arabian civilization must be assumed. Perhaps the earliest ref-
ence to the land in the Babylonian inscriptions is found in an
omen tablet and in the Neo-Babylonian Chronicle which record the
successful expedition of Naram-Sin against the land of Magan, and
the taking of its king captive, whose name was Mannu-dannu.
(King Chron. II 51 f.) Magan is regarded by some as being in
the Sinaite Peninsula; but by others as a part of Eastern Arabia,
which region is more accessible to Babylonia. A little later, Gudea
mentions having transported heavy blocks of diorite from Magan
(FIP. 66, etc.).

The Arabian inscriptions, above referred to, came from four
chief nations, the Minaeans, Hadhramotians, Qatabanians and the
Sabaeans-Himyarites. It is by the help of these inscriptions that
considerable knowledge of ancient Arabia has been gained. For
the present discussion of the Arabian theory let us note some of
the names of the chief gods contained in these inscriptions, as well

as the composition of the personal names, in order to test the claim that the civilization of the Amorites, Hebrews and Babylonians had its origin in Arabia.

The chief deity in these inscriptions is the god ‘Athtar, who is the personification of both the morning and evening stars. It is generally thought that the god ‘Athtar and the goddess Ashirta or Ishtar were originally the same deity. Some hold that Athtar was the earlier form, but see Chapter XVII. The second deity in importance is the moon-god, who has a different appellation among each of the four peoples mentioned. The Minaeans called him Wadd; the Hadhramotians called him Sin (doubtless, borrowed from the Western Semites); among the Qatabanians he was named ‘Anum; and by the Sabaeans, Imaqqa or Almâqu-hû. The third deity of the South Arabian pantheon was called An-Karah by the Minaeans, Huwâl or Hôl by the Hadhramotians, and Anbay (regarded the same as Xabû) by the Qatabanians. Sun deities, who are always goddesses, usually with local names, tutelary deities of cities such as Ta’lab of Riyâm, the god Samî’, Nasr, Qainân, Rammân in Shibâm (doubtless, to be identified with the Rimmon of Damascus, or Ramman of the Babylonians), Hagir, Dhû-Samwâ, Dhaw, Môtab-Nâtiyan, Niswar, Il Fakhr, Zûr, are some of the prominent deities mentioned in the inscriptions. In short, these South Arabian inscriptions offer considerable material on the deities of the land. And from our knowledge of the permanency of the manners and customs of the land it is safe to conjecture that in the periods preceding that of these inscriptions the religion very likely was in a general way practically the same. The study of the personal names as an adjunct of the religious ideas expressed in the inscriptions furnishes also valuable criteria, since they indicate what deities the people worshipped.

It is scarcely possible that any one would regard the moon-god Sin as of Arabian origin because the inscriptions show that he was worshipped by the Hadhramotians, and because his name is probably connected with the mountain called Sinai and with the desert

II. THE HOME OF THE SEMITES.

35
called Wilderness of Sin. And it is scarcely possible that any one would regard Nabû as Arabian because of the name of the god Anbay, worshipped by the Qatabanians, who is considered by some to be the same. Hadad, whose name occurs in two inscriptions, would scarcely be regarded otherwise than an importation. In short, there can be no question but that these three gods are West Semitic (see Chapter XVII).

We have seen that if movements of peoples have taken place, there will be unmistakable evidence of them in case large groups of personal names have been preserved; and that in the absence of definite historical statements concerning conquests, invasions, bondages, etc., no better evidence is known than that secured from a study of the personal names. Having before us the elements of the ancient Arabic civilization that we should expect would be carried with the people if they migrated, as has been claimed, as did the Amorites, Hittites, Cassites, etc., we inquire to what extent have those which are peculiarly Arabian been transported to the other lands, in these so-called five periodical waves of migration. The burden of the proof, naturally, that such evidence exists, and that these waves actually took place, lies with those who hold these views; nevertheless, let us inquire whether there are any grounds upon which these hypotheses can rest.

In searching for evidence in the Babylonian inscriptions and other legends bearing on the early history of that land, we first note that the legendary list of ante-diluvian kings of Chaldea handed down by Berossus, shows that the names are Amorite\(^8\) (see Chapter VIII). The early dynastic lists, as we shall see, show the same. In the votive inscriptions, the religious texts, the building inscriptions, the seal impressions on tablets, etc., we look in vain for anything that is characteristically Arabian. On the other hand, the influence from Amurru, whose civilization is as old if not older

\(^8\) Syncellus gives two dynasties after the flood, the first he designates as Chaldean, and the second Arabian: the names of the latter are: \(\text{Μαρδακατιγς, Μαρδακος, Σαμαρδακος, Ναβις, Παρατος, Ναβοναβος.}\) It is thought by some that this list is spurious serving the purpose of filling out the gap between the deluge and the first king of Assyria. See Poebel UMBS IV 87. Certainly they cannot be proved to be Arabian.
than Babylonia, is much in evidence in the earliest historical period (see the succeeding chapters).

In turning to the nomenclature of the Babylonians of the early period, alphabetically almost the first names that confront us are those compounded with Abu, "father," and Alu, "brother," which are used instead of the name of a deity. Hommel, followed by Pilter, Paton, and others, regard these elements as of South Arabian origin. The writer sees no reason whatever for regarding them otherwise than as common Semitic. Moreover, while Alu is a very common element in Babylonian names, in fact in the Name Syllabary published by Chiera over one hundred and fifty different names are compounded with it, and it is found in nearly a score of different West Semitic names in the Old Testament, as far as is known to the writer, it has thus far only been found once in the South Arabian inscriptions of all periods.

Some have been disposed also to look upon 'Amm or Hammu, 'paternal uncle,' as Arabian; but even this seems to have been generally given up, which is due to the fact that it is so frequently met with in the West Semitic inscriptions, especially in the early period (see Chapter XI).

The only attempt known to the writer at identifying an unmistakable Arabian deity as an element in names found in Babylonia is in the case of wedum in Aghi-wedum. Pilter, apparently, following Ranke (PN 63) reads Aghi-wadum, and translates "My brother is Wadd." To show that this is impossible it is only necessary to quote other names constituted with this element wedum or edu usually translated "the one," as Wedum-liblut, Samas-wedum-uṣur, Tabba-wedi, Tabba-edi, etc. (see Chiera UMBS 11, 158). In short, after searching for elements that can be said to be charac-

\[9\] *Ancient Hebrew Traditions.*

\[11\] *Biblical World* XLV, p. 294. Paton also regards sumu, "name," and the imperfect of verbs formed with the prefix ya as characteristic marks of Arabian Origin.

\[12\] Even Pilter, who regards the names of the Old Testament compounded with Alu as Arabian says: "Akhi meets us in the South Arabian inscriptions but rarely: there is Akhukarih" *PSBA* 38 p. 156.
teristic of Arabian civilization, no other conclusion can be arrived at but that they are wanting.

In this connection it is proper to inquire what Hebrew tradition has to say on the subject. The Hebrews looked upon Mesopotamia, or the district between the Tigris and the Euphrates, as the cradle of mankind. They also made the second beginning of man’s history to emanate from Armenia, in which country the ark rested. It is an interesting coincidence that many Aryan scholars look upon this region as the probable home of the Sanskrit group of languages.

The writers of the table of nations in the tenth and eleventh chapters of Genesis, in giving a history of the family which became the nation Israel, felt the necessity of accounting for the divisions of mankind after the flood, and of showing how the peoples were related. The sons of Aram, the descendant of Shem, are: Uz, Hul, Gether, and Mash. Hul and Gether have not been identified as yet, but Uz is understood to represent the peoples of Job’s fatherland in Arabia, not far east from Edom; and Mash represents the district of Mashu, in which was the important city Ki-Mashk, or Damascus (see Chapter XII). If Uz has been correctly identified in North Arabia, we have here at least a distinct effort on the part of the Biblical writer to account for the Arabsians.

Another descendant of Shem, Arpachshad, begat Eber, whose sons were Peleg and Joktan. Thirteen sons of Joktan are mentioned, who are understood to represent peoples of Arabia. In other words, we have here another effort by the Biblical writers to account for the origin of the Arabian nations. Their view is that they emanated from the north.

The descendants of Peleg are given as: Ren, Serug, Nahor, Terah, and Abram. Sarug, or Serug, is found to have been the name of a district in the land of Aram; and Nahiri, or Nahor, is close by Serug (see Chapter XI). Here the writer places the home of the Hebrews, following the former current view.

It is needless to refer to the fact that modern criticism does not regard the tenth chapter of Genesis or any other similar effort in the Old Testament as having any historical value as regards the origin of the races. No one would question that the separation of the peoples referred to took place at a time very far removed from
the historical period. But it must be conceded, at least, that the
writer or writers looked upon the Aramaeans as one of the nations
of a great antiquity; and that the view of these writers was that
Arabia was populated by people from the north. What traditions
they possessed, upon which their views were based, we, of course,
are unable to say. It would seem, however, that their opportunity
for knowing at least something about the early history of the Ara-
maeans, that is, their own ancient history, was at least greater than
that enjoyed by those modern scholars who begin the history of
Abram and the Hebrews with the exodus of the Aramaeans from
Arabia, or even Egypt, in the latter half of the second millennium
B. C. The theories advanced from this point of view, which are
developed in a wonderfully ingenious manner, of course, do not
recognize even a medium of truth in these legends concerning the
patriarchal home in Aram. Such views are maintained in spite
of the fact that history, archaeology, and philology have restored
for us the background for a Semitic civilization in this region with
an antiquity very much earlier than the period of the conquest;
and in spite of the fact that nothing has been revealed to substan-
tiate their theories. There is every reason to believe that when
the time arrives for the ruin-hills of this district to be opened up,
we shall become acquainted not only with a civilization as ancient,
if not more so, than any known at present, but also much evidence
to show that in the traditions handed down by the Hebrew writers
there are reflections of great value for the reconstruction of the
history of the Northern Semites.

The second wave of Arabs which is supposed to have brought the
Semitic population to Palestine, in the second half of the third
millennium, and a great influx into Babylonia at the time of the
First Dynasty of Babylon, has received more attention largely
because of the excavations in Palestine and the great mass of
inscriptions found in Babylonia belonging to this period.

The theory that the rulers of the First Dynasty of Babylon were
of Arabian origin, which for a time many were wont to adopt, origi-
nated with the French scholar, Pognon (JA XI, 543), who merely
suggested, as early as 1888, that the dynasty might be either of
Arabie or of Aramaic origin. Two years later Sayce called atten-
tion to the name Ammi-zaduga, the tenth ruler of the First
Dynasty, as occurring in the South Arabic inscriptions; and he seemed to think that some of the names of the First Dynasty of Babylon were Arabian. Hommel, to whom the elaboration of the theory is due, later tried to show that all the names were Arabian; but he admitted at the time that he thought "both Hammurabi and his successors must have assumed Canaanitish names either for political reasons with a view to conciliating their Canaanite subjects, or possibly because they had married Canaanite wives and thus condescended to show their love for them." (Hebrew Tradition, p. 92.) Winckler, however, maintained that eight of the eleven names are Canaanite, while two, Apil-Sin and Sin-muballit, are Babylonian, leaving Zabium uncertain (Geschichte Israels 130 ff.). The view that the First Dynasty rulers were Canaanites or Amorites, now seems to prevail, and that they were of Arabian origin seems to have been given up.

Hommel also maintained that many of the foreign names occurring in Babylonian inscriptions of this period were also Arabian (Ibid. 110 ff.). Ranke, in his Personal Names of the Hammurabi Dynasty, fully discussed the question of the Arabian origin of the foreign names. One can not help admiring Ranke in attempting

---

13 The hypocoristic atu attached to masculine as well as to feminine names, because of numerous examples found in the Safaitic inscriptions is regarded by him as a characteristic mark of their Arabic origin. But most of the names to which this ending is attached are Babylonian. This ending is also found in the Cassite period, when little foreign Semitic influence was felt in Babylonia. Moreover, the names of the Safaitic inscriptions, having an affixed t, with which they were compared, belong to the period of our Christian era, from the second to the four century, or later. The score and a half of other names, which are compared with these Safaitic names, must be looked upon in the same light. And besides, many of the elements are found in the Northwest Semitic inscriptions; which fact, however, Ranke noted. Nor can the comparison of about a dozen names with those taken from Ibn Doraid (of the ninth century A. D.) be taken seriously in this connection. This leaves eight of Ranke's list which he compared with South Arabic names; two of these, Nakarum and Tinkarum, are compared with Jinkar, said to be an Arabic tribal name. Four others, Abi-čšuh, Ammi-zaduga, Jadah-ilu, and Jadah-halum, are compared with Arabic names, but these are also well known North Semitic elements.
to defend his teacher’s theory, but on close examination the stability of the whole contention vanishes like the morning mist.

Not only are the rulers of the First Dynasty considered Amorite, but also, as will be shown later, the contemporaneous dynasties of Larsa and Nisin, and perhaps also of Erech (see Chapter VIII), for West Semitic foreigners also sat on these thrones. And is there any evidence of Arabic influence in the literature of this era? As far as is known to the writer no trace of it has thus far been observed.

What is true of Babylonia is also true, as shown above, of Assyria about this time, for the early rulers also bear West Semitic names (see Amurru, p. 140). It is interesting to note here that King has recently commented on this point, in the words: “We may assume that Assyria received her Semitic population at about this period as another offshoot of the Amorite migration.” (HB 136 f.)

Unfortunately up to the present time no inscriptions from the Northwest Semitic peoples belonging to this period have been found, except the cuneiform tablets in Cappadocia. We therefore inquire whether there is any evidence to be gathered from the Cappadocian inscriptions for the supposed Arabic migration in the latter part of the third millennium. The answer is in the negative. Instead of Arabic, we find Amorite or West Semitic elements much in evidence in their personal names, such as the gods Ashir or Ashur, Ashirta, Shamash, Amur, Anu, etc. (see Chapter XII).

It has been asserted that the Semites who dispossessed the troglodytes at Gezer, in this period, were Arabs. This is an assumption pure and simple. The Amorites flourished in the Lebanon

This leaves Ra'ibum, which was compared with Ra'ab and Ra'ab-el, and Zamzum, compared with Shams, the name of the sun-goddess. The latter comparison needs no comment, and the former is a Hebrew name, cf. Ra'-a-bi-el, BE IX 44: 16 LE. In a note, two names which he later published (BE VI, 2), Jašmah-el and Jaškur-ilu, are compared with םימניא and לברא. The former, however, is also an Amorite name, and the latter the writer cannot find in Pilter’s index of names, PSBA 39, 99 ff. It should be noted that Ranke also suggests a comparison of the elements sumu with the South Arabic ﯼﯿ; zimrî with ر”; and یšhî with يٰعٰنٰ.
II. THE HOME OF THE SEMITES.

region millennia prior to this era, and geographically Canaan was a part of Amurr in this period (see later Chapters). Moreover, the Semites, whose existence in Palestine has been noted through the excavations, are very probably Amorites. This seems highly probable when we take into account, as noted above, that about this time three different Amorite dynasties had been established in Babylonia; that Amorites had possession of Assyria; and that it is not impossible that Amorites were responsible for the dark period in Egyptian history which also synchronizes with this period. Since we have no evidence whatever of an Arabian movement at this time, it seems perfectly reasonable to assume that the Semites, who dispossessed the cave-dwellers at Gezer and perhaps the dwellers on other hills of Palestine at this time, were of the same stock, namely, Amorite.

After an examination of the eight names in the fourteenth chapter of Genesis, Pilter concludes that four are probably Amorite: that Bera' is an Amorite form of the Arabic bar'ā; that Birsha' is from a quadriliteral root in Arabic; that Shinab, which is synonymous with the Babylonian Sin-abu, is Arabian; and that ‘Aner, which was very likely ‘Am-ner, is also Arabian (PSBA 36, 212 ff.). Even though the latter conjecture should prove correct, for which there is no justification in any of the different forms of this name in the versions, ‘Amm can only be regarded as common Semitic (as above). If Shinab is a corruption of Sin-abu, the name can only be said to be Babylonian. Further, no such personal names as Bera' and Birsha' occur in the South Arabian inscriptions. The writer thinks that it will be generally conceded that the effort to show Arabian influence by these names is not very successful.

The name Abram, or in the fuller orthography, Abraham, which for years has been regarded by certain scholars as Arabic, is not found in the Arabian inscriptions. On the other hand, both elements of the name have been found in the West Semitic and in the Babylonian inscriptions. About a decade ago Ungnad found the name Abram (A-ba-ra-ma, A-ba-am-ra-am, A-ba-am-ra-ma), but recently Lutz found the fuller form on a letter in the Yale Babylonian Collection, namely, A-ba-ra-ha-am (EBL p. 5), which was written in the era of the patriarch.
Here also properly might be mentioned the Biblical tradition concerning the descendants of Ishmael, the son of Abraham by Hagar, in accounting for the Bedouin, who with a primitive and patriarchal mode of life roamed over the deserts lying between the Sinaitic Peninsula and the Persian Gulf. He was the father of twelve princes or tribes who dwelt from Havilah unto Shur, i.e., before Egypt "as thou goest towards Assyria" (Gen. 25; 13-18). Here also the tradition concerning the six sons of Keturah, the second wife of Abraham, representing Arab tribes south and east of Palestine, might be mentioned. These can only be regarded as traditions which indicate that the Hebrew writer understood that the Aramaeans from the north had settled Arabia. The Midianites also are regarded as the half brothers of Isaac and Ishmael.

The third periodical "disgorging" period, according to Winckler, Paton, Luckenbill, and others, is the so-called Aramaean, which began about 1500 B.C., and lasted for several centuries. Before this time it is claimed that no trace of the Aramaeans is found on the monuments; the first sure sign of them in the Egyptian monuments is the name Darmeseq for Damascus in a list of Ramses III (1198-1167 B.C.). No credence, as noted above, is placed in the Biblical tradition concerning the ancestral home of the patriarchs in Aram. The conclusion follows that this is a mistaken theory that was foisted upon Israel in the late period, and accepted by them. The people we know as the tribes of Israel are regarded by some as Arabs, who came out of Arabia, and by others as Aramaean nomads who lived in the desert south of Canaan, known by the collective name of 'Abraham.' About 1200 B.C., they invaded and conquered Palestine. They had no higher culture of their own, but adopted that of the people they conquered. Isaac and Jacob also were clans, not individuals. While there are those who believe that an 'Abraham' people united with a 'Sarah' people and entered Canaan as early as 2000 B.C., the 'Isaac' and 'Rebekah' tribes were later waves of Aramaean migration which absorbed the Abraham and Sarah people. The third wave was 'Jacob,' and the fourth was 'Israel.' Leah, which name means "cow," and Rachel, "sheep," are merely collective names for the 'cowboys' and 'shepherds,' two main groups of tribes that entered Canaan from the south and east respectively. Since the
discovery that there was a country named Muṣri in North Arabia, it is claimed by some that Misraim, "Egypt," was confused with it, and that this is the place, i. e., Muṣri in Arabia, whence the Hebrews migrated. Others hold, in view of the fact that there was a Goshen in South Palestine, that what is known as Israel entering Palestine was a movement of some tribes from South to North Canaan. There are, however, scholars who still believe that Israel, or at least a part of the people, lived in Egypt.

The evidence for this so-called Aramacan migration from Arabia, which overflowed Syria and other countries at this time, as far as the writer can ascertain, is confined to the references to the people called Ḥabirī in the Amarna letters, and to the conquest of Palestine by the people we know as the Hebrews. There may have been other archaeological or historical evidences offered for the "disgorging" of Arabia at this time, but the writer is unacquainted with them.

If the Hebrews came out of Arabia at this time, it certainly would seem that at least some hints of such a movement would be found in the mass of literature about this period which they have handed down. There is not a particle of evidence to substantiate the idea that this movement was from Arabia; and it seems to the writer wholly unnecessary to discuss extensively this question until such has been produced. The story of Israel in Egypt, which land we know received so many obscure tribes, its sojourn in Goshen, the building of store chambers with sun-dried bricks, the references to the Nile and to Egyptian life at court and in the home, the personal names of individuals, everything has the proper coloring and is entirely true to what is known of the land. Not only is the atmosphere correct in the account of the people's residence there, but also the references to Egypt after they had departed and lived in the wilderness, to which the narrator frequently looks back. With the story of the sojourn in Egypt and in the wilderness in our possession, and in the absence of even a single hint of any other origin for the Hebrews who entered Canaan, the proof of the assertions, which are so often set forth as historical facts, rests with

14 For a review of the literature on Israel's conquest of Canaan, see Paton, JBL 32, p. 1 f. (1913).
those who make them. The present writer, until archaeological or philological evidence is forthcoming to show that the contrary is correct, is content to hold the view that the Hebrews, with the civilization they possessed, would not have accepted in the succeeding centuries such an account of the humiliating origin of their nation, if it had not been fact.

The writer is cognizant of how modern criticism regards the genealogical lists in Chronicles as well as in other books of the Old Testament. Those in Exodus, Leviticus, Numbers, Deuteronomy, and Joshua, with their hundreds of other details, may be looked upon in the same general way; and yet if the Hebrews are of Arabian origin, it seems that there would be some trace of this fact found in these lists, especially as the nomenclature cannot be said to be that of a period of the later or dual kingdom. We peer in vain for those characteristic marks of what we know to be peculiarly Arabian. It is quite reasonable to infer that the Hebrews who came out of Egypt and who lived in the Sinaitic Peninsula for a time should have intermarried with the dwellers of that region; and it would not be in the least surprising to find in the nomenclature that they handed down such constituent elements in their names as would conclusively show such contact with the Arabs as, for example, we have so well illustrated in the Marashū Archives, found at Nippur, where the contact the Hebrews had with the Babylonians and Persians through intermarriages is so apparent in the personal names. Even this has not been pointed out by those who hold the Arabian theory, as far as is known to the writer.

If this so-called 'Aramaean invasion' received its name from the fact that the Hebrews who entered Canaan are Aramaeans, the designation is that of the Biblical tradition, for it regards them as such. If, however, it is understood that these Aramaeans are Arabs, who by reason of the crowded condition of Arabia, as has been claimed, came forth from that land, the term is, to say the least, confusing. Aram is not in Arabia.

The identification of the Ḥabiri with the Hebrews, made simultaneously in 1890, soon after the discovery of the Amarna tablets, by both Conder and Zimmern, has been ever since the subject of considerable discussion. Not a few scholars have inclined toward this view in one form or another. Some claimed that they
represent the Hebrews entering Palestine; others, that they represented a portion of the people that left Egypt in advance of the main body; still others maintained that they represented roving bands of Hebrews from the wilderness. The present writer formerly inclined to the view that the Ḥabiri represented the Hebrews entering Western Canaan under Joshua, because, besides other reasons, the chronology of this event synchronized with that of the Ḥabiri invasion.\(^{15}\)

The fact that ‘Ibri could be properly reproduced in cuneiform as Ḥabiri, together with other considerations, seemed to make the view appear reasonable. However, certain other facts make it now possible, the writer feels, to explain their identity in another way: namely, that the Ḥabiri were mercenaries or subjects in the service of the Hittites, perhaps Aramaeans; probably, however, they may have been a branch of the Hittite-Mitannian peoples.\(^{16}\)

\(^{15}\) The writer in 1907 held that the late date of the Exodus based upon the excavations of Naville at ancient Pithom rests upon inconclusive grounds, as became evident from his own account of the excavations; and that Thutmose III in every respect fulfils the requirements of the character, etc., of the oppressor portrayed. The name of the city called Ramses in the Old Testament, which was called Zoan in earlier times, very probably was known by this name when the account was written, the same as the name of the land in which Joseph placed his father and brethren (Gen. 47:11). This view that Ramses II was not the Pharaoh of oppression was anticipated by Ohr several years earlier. (See Light on the Old Testament from Babel 267 ff.)

\(^{16}\) The reasons for this conjecture are found in the writer’s Personal Names of the Cassite Period, p. 42 f., which in brief are the following: Not a few letters give evidence that the Ḥabiri were identified with the Hittites who were encroaching upon the land from the north. The discovery by Winckler that in the Boghaz-köi tablets there is a list of deities which had iláni ḥa-ab-ri ṭi “gods of the Ḥabirī” written at the close of it, and in a parallel list iláni ȘA-GAS, an ideogram standing for Ḥabirī, and a term meaning ḥabbatu “plunderers,” shows the same. Unfortunately, as far as is known to the writer, the text of the tablet or tablets has not been published. (More recently the ideogram ȘA-GAS has been found on temple records of the Larsa Dynasty, where it seems to refer to officials or workmen living in Babylonia.) The occurrence of several personal names found in Babylonian tablets of the Cassite period, which can be iden-
In the Babylonian tablets of the Cassite period, besides Hittite-Mitannian, Cassite names prevail. There are also a few Elamite names, besides small groups which represent other peoples, some of which at present cannot be determined. The occurrence of the foreign names in the nomenclature of this period indicates either extensive migrations on the part of the Hittite-Mitannian and Cassite peoples, or historic events of considerable importance, accounting for the movement of these peoples. Naturally, the fact that the rulers of this dynasty were foreigners whom we call Cassites, accounts for the royal names and the many other Cassite names. The presence of so many Hittite-Mitannian names is better understood when we take into account the fact that the dominant people in the Northwest at this time was the Hittite; and that the Mitannian people had taken possession of Aram; which is evident from the Amarna letters, and from other sources. There is a striking fact to be noted in this connection; the Amorite names so prevalent in the nomenclature of the previous period, namely that of the First Dynasty of Babylon, have very generally disappeared, at least this is the case in the thousands of documents already studied. In other words, migrations of the Amorites into Babylonia, so conspicuously noticed in nearly every other period, are absent at this time. Foreign Semitic peoples do not seem to be in evidence in this era. And in particular, it should be added, the influence from Arabia in this period, as indicated by the nomenclature, is nil, at least as far as has been observed. If, therefore, Arabia was sending forth at this time, as has been claimed, one of its periodic waves of hungry tribesmen into the more favored regions round about, they must have avoided Babylonia. In short, the inscriptions of Babylonia offer no more evidence of a movement from Arabia at this time than can be shown from any other source.

Identified as being Hittite-Mitannian, namely Ḫa-bi-ri Ḫa-bi-ir-ši, and perhaps Ḫa-ša-ra-nu, point to the probability that this designation was identified in some way with those peoples. These facts make it reasonable to look upon the Ḫabiri not as Hebrews from the desert, but as being peculiarly related to the Hittites, if they are not Aramaeans.

17 See Clay, BE XIV, XV; UMB 8 II, 2; and PN.
Several of the Amarna tablets speak of another people employed or utilized in the same manner as the Ḥabirī, namely, the Sutū. These are said to be nomads of the Syrian Desert. In one letter they are mentioned with the Ḥabirī as supporters of Namiawaza (No. 195); and in another, Dagan-takala appeals to be delivered from the hand of the Ḥabirī (Sa-Ga-as) “the robber people” (amēlāti ba-ba-īi), and the Sutū (No. 318). Probably the Sutū were Semitic mercenaries, and the Ḥabirī were Hittite.

In connection with the proposed identification of the Ḥabirī with Hittites, attention might be called to the name of the city of Hebron, where the children of Heth lived, and from whom Abraham bought the cave of Machpelah. The name of the city in Abraham’s time was Mamre, and it is also referred to as Kiryath-Arba. Later it was called Hebron. It is not impossible that the name Hebron (Hebrôn) is a formation on ʿon (=?ān) from the word Ḥabir(i), like Shimshôn from Shemesh. Moreover, the city received its name in the period of Hittite ascendancy.

The so-called Nabataean or fourth wave of migration need not detain us long. The Nabataeans are a people living in Edom in the latter part of the last pre-Christian millennium. It is thought màr Na-bat-ai in a letter of Ashurbanipal’s time (Harper ABL 305), refers to an individual from this nation, whom Streck regards as an Aramaean. Others seem to think màt Na-ba-a-a-te in Ashurbanipal’s Annals refers to the country of the Nabataeans, and is perhaps to be identified with Nabaioth, the son of Ishmael. Gen. 25: 13. It will be noticed that at least two of the few names identified with the country at this time, namely Ha-za-el, the father of U-a-a-te-’, king of Arabia, and Bir-Da-ad-da,18 the father of U-a-a-te-’, are Aramaean; perhaps the name U-a-a-te-’ is also Aramaean.

The extant names of the Nabataean inscriptions which belong to the first century B. C., it is claimed, contain more Arabic than Hebrew and Aramaic names. It is thought that the Nabataeans pressed upon Edom from the adjoining land, east of that country, and made Petra their chief city. Even though it could be shown

18 Ashurbanipal’s Annals VIII: 2.
that the majority were Arabs who used the Aramaean language, this fact would hardly justify the statement that Arabia, the cradle of the Semites, was sending one of its thousand year periodic waves over the surrounding lands.

No one would deny that Islam as a military power in the seventh and eighth centuries of the Christian era overran the Near East, and even parts of Europe, and established its civilization wherever it went; but this is not to be accounted for as being due to Arabia being overcrowded, but because of lust for loot and power.

No one would attempt to deny that Semites from Arabia have constantly filtered into Syria. Many entered to range during certain seasons of the year, like the 'Anezeh or Ruwalla peoples at present, or as the Midianites did in Biblical times; while others naturally were attracted to the cities and to the agricultural districts. After the Jews had been carried into exile, the Edomites pressed into their lands in the south of Judah. Petra, about 300 B. C., fell into the hands of the Nabataeans. The Decapolis was created as a Greek league to promote interests in trade and commerce, and also for mutual protection from the surrounding peoples. In the first century of our era, the Beni Jafna migrated from Yemen, and some centuries later founded the Syrian dynasty of the Ghassanides; and later on, Islam overran this part of the world. All such movements towards this highly delightful and fertile region, called "God's land" by Thutmose III, were perfectly natural. Peoples came from all directions. But nevertheless the origin of Semitic life in Amurrn is not to be explained as resulting from such incursions. We have knowledge of too many other movements into the land, as the Hittite, Mitannian, Philistine, etc., to be misled with such a conception of the land's history. Every fact bearing upon the subject in the early references to the land of Amurrn, as will be seen in subsequent chapters, points to it as a home of the Semite, reaching back into prehistoric millenniums, with a civilization of no mean character; and indicates also that from this land Semites radiated in all directions. Moreover, as stated above, the ultimate home of the Semitic race belongs to anthropology, and is a question which there is no desire to discuss.

In conclusion, the writer simply wishes to ask those who continue to maintain this theory to satisfy themselves as to why the fair
lands of Amurru and Akkad, with their attractive climates and fertile lands, a veritable 'Garden of Eden,' where the oldest civilizations of which we have knowledge are to be found, should have been dependent for their inhabitants upon such a breeding place as Arabia. In short, from whatever point of view this theory is examined, it is found wanting.
III

THE COUNTRY AMURRU

The chief lands in which the Semitic peoples of ancient times have lived are located in that great parallelogram roughly bounded by the Taurus Mountains, the Tigris River, the Persian Gulf, the Indian Ocean, the Red Sea, the Isthmus of Suez, and the Mediterranean.

The northern part of this territory, known as Syria and Mesopotamia, is fertile, as well as stretches of lands along the coast on the lower part of the Red Sea, the Gulf of Aden and part of the Persian Gulf. A considerable portion of the balance of the territory is barren, but yet it is dotted here and there by small and large oases of great fertility.

The only time this great stretch of territory was united politically was when Islam dominated it. In other eras, considerable districts had come under separate rulers, but the character of the land, with its great deserts, and mountainous districts separating one part from another, was responsible for the lack of amalgamation or cohesion of the peoples, and for the breaking up of the territory into separate and distinct provinces.

The northern part of this great Semitic world, at present called Syria and Mesopotamia (or El Jezireh), and styled 'the fertile crescent,' lies in a peculiarly central position between Africa and Asia, as it were, although strictly a part of Asia. To the northwest was Asia Minor, a gateway to great nations beyond—the Hittites, Greeks, Romans, and many other peoples. To the north lay the Scythians, and other nations whose influence and history is only slightly known, many at present not even by name. The Assyrians, Babylonians, Persians, Parthians, and other great peoples lay on the east. In the south were the Arabs, a people of the same race, also the Egyptians and Ethiopians; and on the west the Mediterranean. Syria has often been likened to a bridge with the sea on the one side and the desert on the other, connecting Western Asia
III. The Country Amurru.

and Africa. By reason of its position, the land has been the scene of many invasions and contending armies during the past milleniums of its history. Here the Egyptians, Amorites, Hittites, Assyrians, Babylonians, Persians, Greeks, Romans, Arabs, Turks, and other peoples have contested for the supremacy of the land; the last effort being that of the English and French against the Turk and German. If the earlier history of the land can ever be written, doubtless many other struggles of nations on this battlefield will become known.

Amurru, with its diversified features of snow-capped mountains, tablelands, fruitful plains, and tropical valleys, accommodated besides the agricultural and pastoral Semites who abode in houses and tents, various races, some of which lived even in caves of the earth. In this way, nature fostered, in the compass of this region, people of the mountains, valleys and cities, who led lives which had little in common. As a result, cave-dwellers lived in the hills of Palestine to a comparatively late date; while doubtless the agriculturist and the Bedouin had flourished in the valleys and plains about them for millenniums. Gradually, however, the cave-dweller was supplanted by those who sought the hills on which to build fortified places or walled towns, and in this way to protect themselves against invaders.

Phoenicia and the cities of the Lebanon coast, due to the natural products of the land, were especially attractive to sea-faring peoples, resulting in a great admixture of races that produced a peculiar type, whose contributions to the culture of the ancient world were extensive. Syria with its Orontes, Euphrates, and other rivers, and great stretches of plains, was the home of peoples reaching back into a hoary antiquity.

The conditions from a geographical point of view throughout this part of the Near East, are supremely favorable for an extended and continuous occupation. The climate, the soil, the natural highways offering communication in all directions, all suggest the idea that it was a land that teemed with a great population in ancient times. Its rivers, lakes and seas, its mountains and its cultivated hills, where the vine grows in terraces and the olive tree flourishes; its rich plains and valleys, all make it a delightful and
highly desirable land in which to live, a veritable land "flowing with milk and honey." As Cicero said in one of his orations, the country "is so rich and so productive that in the fertility of its soil, and in the variety of its fruits, and in the vastness of its pasture lands, and in the multitude of all things which are matters of exportation it is greatly superior to all other countries" (Manilian Law VI).
EXCAVATIONS IN AMURRU

Excavations have not been conducted as yet in the land of the Amorites except in Palestine; and it would appear, from all the light that we have on the subject, that this is the least important part of the great Empire of the Amorites.

The story of the excavations in Palestine has been related many times, yet it seems appropriate in this connection to mention briefly, in a general way, some of the important results that bear upon the subject under discussion.

At Tell el-Hesy, which lies on the edge of the Philistinie plain, the lowest stratum is thought by Petrie and Bliss, who excavated at the site, to represent a period about 1700 B.C., and the uppermost about 400 B.C. The city is referred to in the Amarna letters, but not in the Egyptian inscriptions. It was taken by Joshua; and, according to Chronicles, was fortified by Rehoboam. Besides pottery and remains of walls, buildings, etc., a cuneiform tablet written in the Babylonian language, and belonging to the fifteenth century B.C., i.e., the Amarna period, was found in its ruins.

The city Gezer is mentioned on the Egyptian monuments as one of the cities taken by Thutmose III, about 1475 B.C. Three of the Amarna letters were written by its governor, Japhet. In the book of Joshua we are told that its king, and the men with him who came to the help of Lachish, were slain by Joshua. In the excavations at Gezer, it is claimed that the two lowest strata are earlier than anything found at Tell el-Hesy, and belonged to the Neolithic age. Macalister, who conducted the excavations, holds that the aboriginal dwellers were non-Semitic, of small stature; and that they lived in caves. He thinks that the probable date of their troglodyte dwellings is prior to 2500 B.C. The third and fourth strata which lie immediately above are shown by the scarabs contained in them to belong to the period from the XII to the XIX Dynasties, i.e., from about 2000 to 1400 B.C. The city is frequently referred to in the Egyptian inscriptions, and was occupied
until the Christian era. The earliest inhabitants, the troglodytes, Macalister holds, practised cremation, made pottery by hand, and at times ornamented it. The Semitic people, who displaced the old inhabitants, built a great megalithic high place, practised sacrifice of the firstborn and foundation sacrifice; had many varieties of grain for food; were strongly influenced by Egypt, but much less by Babylonia. Besides figurines, regarded as representing Ashirta, two cuneiform tablets of the seventh century B. C. were found at Gezer, and belonged to the later period, when Judah was tributary to Assyria.

The work of Sellin at Ta'anach shows that the place may have been occupied from about 2000 B. C. up to the time of Josiah, when it was destroyed by the Egyptians or the Scythians. The two discoveries of significance made at Ta'anach besides figurines, are eight cuneiform tablets, and a crude pottery altar of incense. The tablets had probably been preserved in the pottery chest, beside which some of them were found. It will be recalled that in the time of Jeremiah (Jer. 32: 14) important writings were kept in earthen jars. In not a few instances jars have been found in Babylonia containing tablets. The building in which the tablets were found may have been the residence of one, Ashirta-washur, to whom several of the letters are addressed. Guli-Addi offers to send silver to Ashirta-washur; and among other things calls on him to give his daughter, when old enough, to the king (namely of Egypt). Aḥi-Jāmī refers to some weapons he received; inquires whether certain cities had been recovered; proposes to send a messenger Aman-ḥashir (perhaps an Egyptian); and informs Ashirta-washur that he will send on the morrow his brothers with the chariots, a horse as tribute, presents, and all prisoners then in his hands. Besides these letters, tablets containing lists of men, and other fragments, make up the eight tablets discovered. It is understood that these tablets belong to the same general period as the Amarna letters; and if that is correct, the name Aḥi-Jāmī, which is very probably equivalent to Ahijah, is most interesting, since it contains the divine name of Israel's God, written Ja-mi. In the Murashû archives found at Nippur, belonging to the reigns of Artaxerxes and Darius, the divine element in Hebrew names is written Ja-a-ma for Jāwa.
IV. EXCAVATIONS IN AMURRU.

At Tell Mutesellim, which is part of ancient Megiddo, about an hour northwest of Tell Ta'anach, Sellin devoted two years to excavating. Megiddo was captured by Thutmose III; it figures with Ta'anach in the Amarna Letters; was fortified by Solomon; and was the place where Ahaziah died, and Josiah lost his life. Besides buildings, walls, pottery, bronze and stone objects, etc., that were discovered, two seals were found. The one was a jasper seal stone bearing a Hebrew inscription, "to Shema, servant of Jeroboam," who is considered by some to be one of the two Hebrew kings who bore that name. The other seal bore the name of Asaph.

At Sebastiyah, the ancient Samaria, the expedition of Harvard University was able to excavate during parts of three seasons. Here a large palace was found built upon native rock, which is believed to be the palace of Omri. This was later extensively enlarged, and the walls faced with white marble. This is believed to have been the work of Ahab, who is said to have built an "ivory home" (I Kgs. 22: 39). In a building on a level with this palace about one hundred potsherds were found containing some of the earliest specimens of Hebrew writing known. The ostraca are memoranda for wine and oil which had been stored, containing the names of the sender and receiver, amounts, name of place whence it came, and the date. The year of the reign is given, but unfortunately not the name of the king. An old city gate of the Israelite period, ruins of other buildings of later periods, and other remains were uncovered.

More recently, Ain Shems, the Biblical Bēth-Shemesh, not far from Der Aban on the railroad between Jaffa and Jerusalem, was excavated by Mackenzie, in 1911 and 1912. The war brought to a close other excavations that were being conducted at Balata, near Nablus, the Biblical Shechem, and on the Ophel at Jerusalem. Besides these operations, other excavations of a private character have been conducted from time to time by scholars and travellers through which important results have been obtained.

The results of these excavations that have a bearing on the present discussion belong naturally to the early period. Through them we learn about the massive city walls, the plans of the houses, the kinds of weapons and utensils the people used; something about their foods; and the stock they raised; about their religious
beliefs and practices; their methods of burial; the state their art had reached; and about their intercourse with other nations. It is by the help of these facts that we draw our inferences for an understanding of the civilization in this part of Amurr.

It must be admitted, however, that if it were not for the light that contemporaneous records and the Old Testament throw upon the early period, these excavations would give us little conception of the civilization that existed in the land. The excavations conducted in the hills of Palestine, important as they are in throwing light upon certain phases of the early life of the land, and its contact with the surrounding nations, nevertheless furnish us with little understanding of the actual occupation of that region by Semitic peoples. The excavations conducted at Tell Mutesellim, a part of Megiddo, for example, have not furnished materials from which it is possible to draw any adequate picture of the civilization of that city. It is only with the light that we obtain from such a list of booty taken after the fall of the fortress, as that given by Thutmose III, that we begin to appreciate how that district swarmed with life in ancient times. The same is true of the tale of Sinuhe, which throws such a flood of light upon the civilization north of Palestine, about 2000 B. C. (see Chapter XIV). Should fortune favor us with light on Palestine of the same era or earlier, we shall doubtless find, notwithstanding the fact that cave-dwellers lived in the hills, and other foreign peoples were in evidence, that the country teemed with Semites in permanent agricultural settlements; a people who possessed great herds, and who had attained unto a very fair civilization, exactly as the traditions of the Old Testament lead us to believe they possessed.

Without any desire to minimize the importance of the results of the excavations, we cannot help expressing great disappointment in not finding more written records of an early period, such as are found in Egypt and Babylonia. The earliest writings discovered, besides the few cuneiform tablets, are the ostraca, above referred to; the so-called Calendar Inscription found at Gezer, probably going back to the ninth century; the Moabite stone, the Siloam inscription, and a few minor inscribed objects which follow in point of time.

The results of these excavations have led many scholars to con-
clude that the Semitic peoples of Palestine in the early period possessed only a low type of civilization, and were without the knowledge of a written language of their own. True, in the Amarna period they admit the Babylonian language and script had been used for diplomatic and inter-commercial purposes; and some even think that the early portions of the Old Testament were written in this language. Although on the highway between Egypt on the one hand, and Babylonia-Assyria as well as the countries to the north, on the other, and the scene of many battles and conflicting forces, Palestine was nevertheless removed, and in a measure isolated, from the great centres of the Semites. Even, if the city Humurru, which thrived in the third millennium, was the Gomorrah of the Old Testament, as some have inferred, and was situated in this district, we have no other evidence of activity here on the part of the early kings of the East, except the campaign in the days of Amraphel. But although the civilization in Palestine may not have been developed as that of the region to the north and the northeast, unquestionably it was of a vastly higher order than that indicated by the archaeological remains that have been unearthed at the several sites excavated.

While the Amorite empire lasted, the efforts of the Babylonian conquerors were usually concentrated on the Mediterranean and Mesopotamian districts, where the old and more important Semitic centres of civilization existed. These were the favorite regions for invasions, as is evidenced by the inscriptions; but unfortunately, as mentioned above, excavations in these parts have not as yet been undertaken. All the light that can be thrown upon the early history of the country is gathered from contemporaneous sources, and inscriptions of a later period. Everywhere in this broad land the ruin-hills of the past can be seen. On the plain between the Lebanons, along the sea, in the region between the rivers, and notably along the Euphrates can be numbered thousands of sites, many of which when opened up to the light of day will reveal the data whereby the history of the Amorites can be reconstructed; and that empire of the distant past, which has been known heretofore only through descendants of those that have survived its destruction, will take its place in the galaxy of nations that belong to the dawn of history.
THE RACES OF AMURRU

Situated in such a central position, Amurru, into which poured different races from all sides, and for so many generations, was occupied by a people which doubtless ethnologically represented a great mixture, and among whom were found more than one distinct type.

Our present knowledge does not permit us to approach with any degree of accuracy the difficult problem of the distribution of the different Semites throughout the great parallelogram which they occupied. It is however possible to refer at least to three distinct types, which may be called the Arabian, Canaanite, and Aramaean.

The modern Bedouin, according to anthropologists, seem to form a homogeneous unity with little mixture of strange elements. They are regarded as pure descendants of an old Semitic race. They are dolichocephalic, have dark complexion, and a short, small and straight nose. This may be said to be the Arab type. Penned up as it were in Arabia, a country that did not experience so many invasions, the type of the Arab Semite, it would seem, has changed little in millennia. Even if tradition is correct in making Mesopotamia the home of the Semites (see Chapter II), the Arab having lived for so long an era in his land very probably represents the purest type, because the admixture with other races could not have been so great.

With the exception of the impression gathered from the Old Testament that the Canaanite was tall in stature, we are indebted to the Egyptian monuments for our knowledge of the physiognomy of the Canaanite-Amorite. These monuments are especially rich in representations of the dwellers of this part of Amurru. From a study of the characteristics observed upon these monuments it would seem that this race of Amurru, produced by the great mixture of races that existed along the Mediterranean from a very early era, was looked upon by the artists as a clearly defined type. He had broad shoulders and was tall in stature. His head was large and dolichocephalic or long headed; it was somewhat narrow.
like that of modern tribes living in the Lebanon district. The forehead was low and retreating; the nose had a distinctly aquiline curve. Large brows overshadowed their blue or dark eyes. The high cheek bones stood out from their hollow cheeks. The lower part of the face was square and somewhat heavy; and was usually concealed by a thick and curly beard, which was pointed. The lips seem to have been comparatively thin, and a mustache was rarely worn. The hair of the head was either shaved off, or it was allowed to grow long and worn in frizzed curls, hung back of the neck. Women wore their hair in three masses, the largest thrown over the back while the other two dropped on either side of the face upon the breast.

At Abu-Simbel the skin of the Canaanite-Amorite is painted yellow, by which the Egyptian intended to represent a white people; their eyes are blue, and the beard and eyebrows red. At Medinet Habu the skin is painted rather pinker than flesh color, according to Petrie; and in a tomb of the Eighteenth Dynasty at Thebes, it is white; the eyes and hair being light red-brown. At Karnak the skin of the figures is alternately red and yellow.

The Egyptian monuments throw considerable light upon the dress of these Canaanite-Amorites. The peasant, or one from the lower class, usually represented as barefooted, wore either a loin cloth similar to the Egyptian, or he is found wearing a white or yellow shirt with short sleeves, extending below the knees. The hem of the shirt was generally embroidered. The noble or upper class man wore a similar shirt, but over it a long piece of cloth which after passing closely around the hips and chest was brought up over the shoulder, and formed a sort of cloak. This was made of a thick rough wool material and was embroidered with bands, lines, and circles. The color and design were conspicuous. Two large shawls, one red and one blue, arranged so that the colors would alternate, were sometimes substituted for the cloak. A soft leather belt gathered the folds about the waist. A cap and a handkerchief held by a fillet were worn; sometimes a wig, and red morocco buskins, completed the dress.¹

¹ The above description of the Canaanite-Amorite is based on Petrie Racial Types; Sayce Races of the Old Testament, and Early History of the Hebrews p. 20; and Maspero The Struggle of Nations p. 149 ff.
Efforts have been put forth by some to show from these pictorial representations that the Canaanite-Amorites were Indo-Europeans; others have declared the type to be distinctly Semitic, and, as above, represented at the present time by peoples in the Lebanon district. Doubtless the tallness of the stature and even other anatomical characteristics resulted from the race mixture that the type represents, and which the artist recognized. Taking everything, however, into consideration, it is not at all improbable that the type that was predominant in this region, though partially Semitic, represented much that was foreign and perhaps aboriginal.

In Northern Syria there is found at present another type, which may be called Aramaean, also having a striking uniformity, nearly all the heads being brachycephalic. The Armenians and other peoples of Asia Minor show the same uniformity. Investigations have led to the conviction that in early times the country was inhabited by a homogeneous and extremely brachycephalic race. The type depicted on the obelisk of Shalmaneser and the Lachish relief of Sennacherib, it would seem, portray this race; and it would hardly be possible for a modern sculptor to produce a more characteristic representation of what is regarded as the well known Jewish type of today. The Egyptian sculptor of Sheshonk also portrayed Israelites who were subjects of Rehoboam, but he gave them the characteristic Canaanite features. As is known, about fifty per cent of Jews living at present are brachycephalic. Since tradition points to Aram as the home of the Israelites or Jews of ancient time, it is reasonable to assume that they are to be grouped with what is called Aramaean.

The question arises, did the dweller in the Euphrates region represent another type? The status of the early period found in Sumer and Akkad furnish us with material for the study of these people, but besides showing that the Semites wore beards, and knowledge concerning their dress, little of value for the subject under consideration is gained from them. The only statue we have of a ruler designated as Amorite is that of . . . -um-Shamash, king of Mari; but this is headless.

VI

THE LANGUAGES AND WRITING OF AMURRU

The language of Amurru was Semitic. There can be no question that there were many non-Semitic languages in the land, but as far as can be determined at present, in spite of the opinion held by some scholars, it can be said that the prevailing language in all eras was Semitic. The chief evidence of this fact is obtained through a study of the personal and geographical names of the country belonging to every period, early and late. The elements compounded with the names of Amorite deities fully determine this; in fact, our knowledge of the early Amorite language is practically dependent on the study of the personal names.

Chiera in a recent volume of inscriptions published an important syllabary which contained a long list of Amorite names, representing doubtless individuals who had migrated from Amurru into Babylonia (UMBS XI, 1). By a study of the Amorite names contained in the cuneiform literature as well as this syllabary it is possible to acquire not only considerable knowledge concerning the religious ideas expressed by the people in the giving of names, but also most important lexicographical and philological material. In fact, some of the roots lost in Hebrew have left their traces in these names, many of which become explicable by the help of the cognate languages, while others remain undetermined. It is possible to construct at the present time a fair-sized vocabulary of Amorite words of the early period, simply from personal names.

Many names in Cappadocian tablets, with the help of this knowledge, prove to be Amorite. The same is true of many in the Amarna letters, and even in the Egyptian inscriptions. All these facts make it impossible to follow those who hold that not only the Philistines and Phoenicians but also the Amorites were pre-Hellenic invaders from the Aegean Islands, including Crete.

The question then arises, since we are familiar with a number of different groups of Semitic languages, to what branch does the
language of the Amorites belong? Besides the Babylonian and Assyrian, which are now called by many Akkadian, we know two other branches of Semitic languages in the north, namely the Aramaic and the Hebrew. What may be called the Amorite, or the language of the Amorites, is the parent of all these branches. An examination of the philological material furnished us from the many Amorite names on Babylonian tablets, prior to 2000 B. C., and those from the few tablets belonging to the early part of the second millennium B. C. as well as the Amarna letters, and the few tablets found in Palestine, show that the language closely resembles Hebrew.

The language of the Babylonians and Assyrians, or the Akkadian, the writer maintains came from Amurru, and under Sumerian influence developed pronounced grammatical differences. This Akkadian language having been later used extensively throughout Amurru, in turn has left many traces of its influence upon the Hebrew and Aramaic. It is a question whether the language used in Syria at a much earlier period was carried into Arabia and became what we now recognize as Arabic, or whether both are from a source of which we have at present no knowledge.

There is great difference of opinion as regards the kind of script used by the Amorites. Most scholars do not admit that the Western Semites had a script of their own prior to 1000 B. C., when they suppose the Phoenician alphabet to have been introduced. Since in the middle of the second millennium B. C. the Babylonian language and script were used in Palestine, as is evident from the Amarna letters and the Ta'anach tablets, some hold that the earliest records of the Old Testament must have been first written in cuneiform.

It must be admitted that writing is not mentioned in the Pentateuch until the time of Moses. Abraham instructed Eliezer what to say to his people. When he bought a piece of ground, he called the sons of Heth at the city gate as witnesses, although a document may have been drawn up. Jacob sent messengers when he entreated the favor of Esau; Judah in promising to make a payment, gave his staff and the jewel he wore on a cord about his neck as a pledge. These facts, however, do not prove that writing was not practised among the Aramaeans or Amorites. Even if those
referred to could not write, we need only mention that scribes hardly accompanied small nomadic groups.

If the single tablet at Lachish, and the few others at Gezer and Ta'anach had not been found, and the woman had not searched for wood at El-Amarna, at present we could not prove that writing was known at all in Palestine in the second millennium B.C. As a matter of fact, nothing has been found through the excavations thus far to show that the people of Israel were literary even in the first millennium B.C. Why is it that absolutely nothing has been found in Palestine thus far contemporaneous to the writings of the Old Testament to show that these writings actually existed in ancient times.

It is an acknowledged fact, from the antiquities discovered, that Egypt extensively influenced the civilization of Palestine. The Egyptians conquered and ruled the land; and their script was also known in Palestine. Nevertheless, besides such objects as scarabs, and a few steles, nothing has been preserved to show this. True, we know the Egyptian princes in Palestine of the Amarna period wrote to their masters in cuneiform; but was the language of Egypt, of which we ourselves have so much evidence upon the monuments and on papyri, not made use of by its representatives in Palestine? And while, as we said, we have not a scrap of evidence of the Biblical period from Palestine to show that any portion of the Old Testament existed, down in Egypt at Elephantine a large number of records have been found belonging to a Jewish colony of the time of Nehemiah, which among other things refer to the temple the Jews had erected there. In Egypt, as is known, masses of papyri have been preserved. In Palestine not a fragment has been found; but its absence among the antiquities discovered certainly does not prove that it had not been used; for we know that the climate has not been favorable to its preservation.

There are those who perhaps would concede that the Semitic people of this district also used the Babylonian cuneiform script for their own Amorite language, as did the Hittites, Mitannians and the Vannic people for their languages. This, however, does not seem reasonable in the absence of any proof whatsoever. If the Amorites in Palestine had used the cuneiform script for their language, the excavations would certainly have yielded evidence of
this fact—and not only a little evidence, but masses of it, in view of their advanced literary achievements. And what is true of Palestine and the rest of Amurrū is true of Babylonia and Assyria, where tens of thousands of Amorites have lived in many different periods. Even in the time after it is assumed that they adopted an alphabetic script, we ought to find evidences; for clay was an ever ready inexpensive writing material, while papyrus or skins required considerable time to prepare. There are many Hebrew words in the Amarna letters. Some (aside from the personal names) are found in the Cappadocian and other tablets written in the Babylonian language, but not a single tablet known to the writer can be said to be written in Hebrew in the Babylonian script or syllabary. Let us repeat. Other peoples, like the Hittites, Mitannians, and Vannic peoples used the Babylonian syllabary for their languages. This was known throughout Amurrū, of which we have much evidence. Why is it that not a single tablet has been found as yet in Palestine, Mesopotamia, or Babylonia written in the Hebrew language? The answer is, they had a script of their own, which they used upon perishable material; which fact is doubtless responsible for early examples of it not being known at present. The high literary character of the earliest acknowledged writings of the Hebrews, and even the earliest of the Aramaeans, makes it wholly unreasonable to hold the view that such arose in a comparatively short time, and that the people of Amurrū previously had no script of their own. A written and literary language having a long history is certainly presupposed. This great Semitic people, who have handed down an incomparable literature, and whose system of writing was adopted by the Greeks as early as 1200 B. C., or perhaps earlier, certainly had in more ancient times a script of their own as well as their neighbors. A marked development in the script is noted as having already taken place prior to the earliest examples of the writing, and makes it reasonable to conclude that it has a much greater antiquity than at present can be shown by archaeology. Whether the early script was more hieroglyphic in form, or had at least partially developed into an alphabetic script, as had the writing of the Egyptians, who had alphabetic characters in their system in the earliest period of their history, cannot at present be surmised.
Petrie in his excavations of the Egyptian temple at Serabit el Khādim in the Sinaiitic Peninsula found an inscription in unknown characters, which dates from about 1500 B.C. Gardiner and Cowley conjecture that the word b'lt (ba'alat) “goddess” occurs in the inscription, on the basis of which they identify other characters and read a dozen or more words, and rebuild the old theory of the Egyptian origin of the Semitic alphabet.

As is known, the Babylonian language was used in Amurru as early as the third millennium B.C. At present there are no data upon which to base an intelligent theory as to how and when this language and the cuneiform script were introduced in the West. We know that Babylonia in the earliest known historical period had already come into conflict with Amurru. Etana, Shar-banda, Gilgamesh, and others of this era, invaded the land. (See Chapters VIII and IX.) The resources of the country, as well as the loot that could be secured, were inviting also to Lugal-zaggisi, Sargon, Xarām-Sin, Gudea, the kings of the Ur Dynasty, and others. But exactly what movement was responsible for the introduction of the Babylonian language into that region is not known. As it is impossible to state exactly why the use of the Aramaic language spread all over western Asia, including Cappadocia, Babylonia, Persia, and even Egypt, in the first millennium B.C., except that in the Persian period it was the diplomatic language, it is also impossible to determine what was responsible for the introduction of the Babylonian as the international commercial and diplomatic language in the previous and earlier millennia.
THE NAME AMURRU OR URU

The word "Amorite" in the Old Testament has been as familiar to Biblical students during the past centuries as almost any other designation of ancient peoples, but with comparatively little understanding as to what the term meant. This is largely due to the fact that the imperial history of the people came to a close prior to 2000 B.C.

The term "Amorite," used in the Old Testament for a people who lived in Palestine and the region east of the Jordan, as is generally understood, appears only with the gentilic ending and with two exceptions always with the article, hâ'amôrî "the Amorite."

In the cuneiform inscriptions, the name of the land is written phonetically *A-mu-ur-ri-i*, *A-mur-ri-e*, *matA-mur-ri*, *A-mu-ri*, *A-mur-ra*, etc., and with the ideograms *Mar* and *matMar-Tu.* In the Egyptian inscriptions from the time of Seti I the land is called 'mr, which can be vocalized Amôr, and refers to the district or valley now called Beka', between the Lebanons (see Chapter XIV).

Since the cuneiform made no distinction between the *u* and *o* vowels, in view of the pronunciation of the name in Josephus, Ἀμόρ(ε)ω (Ant. I: 13, 1 f.), and that of the Hebrew, Greek, and Syriac versions of the Old Testament, it is certain that the vowel written *u* in cuneiform was pronounced *o*, i.e. Amôr. The doubling of the *r* found in many of the forms is due to the long vowel which precedes. In other words, *Amurru=Amûru*. Although the vowel was pronounced *o* instead of the English *u*, Amurru will

---

1 The LXX transliterated Ἀμορραῖος, Ἀμώρραῖς, Ἀμορραιαῖς, Ἀμόρραῖς, etc.
2 Other phonetically orthographic examples follow: In the time of Ammi-zaduga there is a place near Sippar called *A-mu-ur-ri-i* (Meissner ABP 42:1, 21). In the Amarna tablets the name is written *matA-mur-ri*, *natA-mu-ri*, *matA-mu-ur-ra*, *matA-mur-ra*, *matâtiA-mur-ri*, and *mâlîtiA-mu-ri* also *matMar-Tu*. In the time of the Assyrian period the name is written *A-mur-ri*, *A-mur-ri-e*, etc. (See Toffteen AJSL 1908 29 ff.)

(66)
be used here instead of Amôr and Amorru (u), because the name is thus written in cuneiform, from which most of our material for discussion is drawn.

The difficulties attending etymologies of ancient geographical names are fully appreciated, for they may belong to an era far remote from the one in which we may happen to have evidence that they had been used, a notable example of which is the name under consideration. They may have belonged perchance to former invaders of the land, who were of another race, and who spoke a different language; in this instance, however, this is not probable. Some have held that the name signified 'the mountaineer,' since in the Old Testament the Amorites dwelt in hills. This was supported by reference to the Hebrew word 'ámîr, but this means 'summit,' not 'mountain.' Others have endeavored to show that the word was of Sumerian or Assyrian origin; but in the light of the facts of this discussion, this does not appear plausible.\(^2\)

We know the origin of the geographical name Ashur (Assyria); how the city Ashur gave to the country its name. We are familiar with the history of early kingdoms in Babylonia, how Akkad became dominant among the principalities, and the whole land was called Akkad; and how later Babylon became the centre of a great empire which bore the same name. It can be shown in many instances that countries received their names through the ascendancy of city states. Moreover, like every other empire, ancient and modern, Amurru was governed from a centre, and this, as we shall see, gave the country which it ruled its name (see Chapter XI). Amurru was not only the name of the country, but also the name of the chief deity of the land, as were Ashur, Tilla, Mash, and perhaps Anu (see Chapter XI). In consequence the name of the god and the country will be discussed at the same time, but in each

\(^2\) Amurru is regarded by Langdon as an early Sumerian term for the West land, kûr-amur ‘land of storms,’ written kûr-mar-ur = mat abûbî. He holds that matMar-TU is to be read ma'amâr-rû, a confusion of signs for mata-mar-rû (Babyloniaca VI p. 55). Haupt regards Amurru as an ancient Assyrian name for the Mediterranean like yâm in the Hebrew. He connects it with Assyrian amîrânu and támerti ‘reservoir,’ and ammaru ‘abundance’ (JAOS 38, p. 336).
instance it will be indicated to which reference is made. Owing to the weak consonants 'alef and mem in the word, which readily suffer phonetic changes, the name appears in variant forms. If it had not been for this fact, the writer would not have had the privilege of presenting this work, for much of what is here offered would have been known long ago.

Amôr goes back to an original Amûr, as Ashur is from Ashar. The deflection of the a to o is a very common phonetic change. In early and late Babylonian inscriptions there are Amorite names compounded with the deity's name Amar. In the early period, cf. Galu-d'Amar-Dingir which may be the Sumerian for Amûl-d'El-Amar; in the late Babylonian period, cf. Amar-ra-pa'-i, Amar-a-pa'-i, Amar-na-ta-nu, Amar-ša-al-til; and in the Assyrian texts, Amar-ma'-a-di, etc. Because the deity d'Amuru is equated with d'Amar-Utug(Marduk) (II R 54: 52g), and for many other reasons it seems highly probable that the form of the name Amar is found in this syncretistic formation from which Marduk has arisen. This has been recognized long ago (see Amuru p. 120 ff.).

As is well known, muz: Mar-tu and Marzi are ideograms of or represent the name Amûru; d'Mar-tu and d'Mar are also ideograms for the deity Amûru. This would seem to indicate that Amûr and Mar are related; and this is the fact. As stated above, Amar-Utug became Marduk and Amar-da became Marada. That the names of the deity, d'Mar and d'Amuru are also identical, is conclusively shown by a tablet recently published by Scheil (RA 14, 140), which is a parallel text to one published by Virolleaud. Sar d'Mar in two passages of the former text is reproduced by šar A-mu-ri-im "king of Amûri" in the latter text. And it seems reasonably certain that the shortened form of the name is reproduced in the Biblical Moriah, for which the Syriac version gives Amoríah, as well as the Septuagint in the passage 2 Chron. 3: 1 (see below). It seems therefore that no other conclusion can be reached but that Mûr and Amûr are variants of the same name. Which is the older or original, it is impossible to say.

The vowel of Mar is variously written in the deity's name, the

---

*See Amuru p. 101. In name books the name is generally written with the ideogram d'SUR.*
same as in the name Ashar, Ashir, and Ashur. Besides Mar, the name is written Mer, Me-ir, and Mar.

Mar (which, as above, = Amurru) is found very frequently in early names as in dMarki and dNin-Marki; i.e. the god and goddess of the city Mar (see Chapter X). This form was used in late Amorite names, and may be the origin of the Aramaic mar meaning "lord".

The name of the god written Mer and Mir was carried to Babylonia in the earliest known period, cf. En-Me-ir-ka-ar of the early Erechian dynasty. In the obelisk of Manishtusu, the names Anum-pi-Me-ir and Il-ka-Me-ir occur. It is commonly found in the Ur Dynasty, where about thirty different names are compounded with it, as Mer-ka-ja-na, etc. In the First Dynasty it is found in such names as dWe-ir-a-bu-su, Warad-dWe-ir, Il-ia-ma-
dWe-ir, etc. It is found in the name Tukulli-Me-ir, king of Hana (TSB.1 8, 352). It also is found in the syncretistic name I-tur-
Me-ir (see Chapter XI). In the syllabaries such forms with pre-
fixed ilu "god" occur, like I-li-Me-ir:

The form dMur seems to be confined to the syllabaries of deities, where, like other forms of the deity’s name, it is equated with the sign dIM, indicating that it is a storm-deity like Adad. Moreover, in the light of the above, the writer has no hesitation in asserting that Mar, Mer, Mur* which are largely confined to the syllabaries,

* Cf. the Amorite names in Assyrian texts, Ma-ri-la-rim with Mar-la-
rim-me, etc. Other occurrences of the deity’s name in Amorite names in:
the Assyrian inscriptions are Mar-bi‘-di, Mar-ia-ku, Mar-ia-id-dii, Mar-‘am-si,
Mar-se-te-, Mar(TUR)-sa-ri, etc. Cf. also the occurrences in the personal
names from West Semitic inscriptions like Mar-barak (מברק), Mar-jehoi
(‘יהוי), Mar-samak (מברק), etc. Note also the name of a god or
demon, or rather a depotentialized deity written אטראינור (see Amurru p.
162).

* See CT 25 20: 7; also I-ia-Mi-ir, CT 24 18: R2; and I-ia-Me-ir = dIM.
CT 29 45: 24. Probably אריא of the Zakir inscription should be considered
in connection with Mer instead of Uru (see below). Cf. also איר = Pir’.
Mer or Pir’-Eru in an Aramaic letter, time of Ashurbanipal. Lidzbarski
ZA 31.

* Cf. Mu-ur and Mu-ru = dIM (CT 24 32: 119; 29 45: 21-22); and also
are variant forms of the same deity’s name, that of the storm-god of Amurru⁹ which had been brought into Babylonia; and that they in turn are variant forms of Amur.

The phonetic change of 'Amûr(ru) = 'Awûr = 'Ur, recognition of which followed the writer’s discovery that Amurru was written 'Awuru or 'Uru, in Aramaic, i.e., 'wr (𒉽𒆠). needs no discussion, since it is generally accepted by scholars. That is, 'Amûr and 'Ur are identical. This is illustrated in the Talmudic word for "west," namely 'Ur and 'Uria (𒉽𒆠𒆠), which also means "twilight, evening"; and the feminine 'Urta (𒉽𒆠𒆠) meaning "night." These terms doubtless had their origin in Babylonia, where Jews experienced difficulty in trying to understand how 'Ur (𒉽) which ordinarily meant "light" should also mean "darkness, west," etc. In the Talmud the question is asked, ‘Why is the West called 'Uria and 'Ur?’. The answer given is, because it meant "divine air" (variant, "light"), meaning Palestine.¹⁰ There can be little doubt, since the Babylonian word for "west" was amurru (also written martu), because the adjoining country represented that direction, that the origin of the Talmudic words 'Ur and 'Uria "west," also 'Urta "night," have etymologically to be explained as coming from Amurru or 'Ur.

In the early periods of Babylonian history, by the association of sounds, scribes used different signs having a similar pronunciation to represent the name of the god Urn. Following are some of the signs used, all of which have the value uru, and all of which have been used for the deity’s name.

¹⁰ That Mer(Me-ir) is a reading of dIM, the storm-god, is clear from such passages as CT 29 45:20; 24 32:120; 25 20:8, etc. In CT 25 20:8 d Me-IR is equated with d Me-IR + IM. Perhaps this form of the name is found in the Old Testament name Meri-ba’al (םינברה) written Meḇṣaḥal in the Septuagint (see 1 Chron. 8:34, etc.).
VII. THE NAME AMURRU OR URU.

This is in strict accordance with our knowledge of the expedients resorted to by the Babylonian scribes (see also under sharr. Chapter XVII). The sign for uru or ur meaning "servant" is used as an ideogram and also as a phonogram in the deity’s names, Uru, and Ur-ra or Ur-ra-gal (Amurru p. 113). The sign ura meaning "brother" is employed in writing the latter name Uru-gal. The sign ura meaning "irrigation"; the sign ur meaning "liver." the ordinary sign uru meaning "city." (Amurru p. 113); the sign uru meaning "whirlwind, city;" the sign BUR-BUR = uru (Amurru p. 113), etc., are all used to represent the name of the god Uru (=Amurru). In short, these many signs standing for the pronunciation Uru or Ur as the name of a god in early Babylonian literature, and also in the late syllabaries, where such obsolete deities’ names of the past were preserved, unquestionably represented the name of the god under consideration.

While the name of the deity is found so extensively in the nomenclature of early Babylonia, it is seldom found after the fall of Amurru, or subsequent to 2000 B. C. It occurs in the Amorite names Û-ru-mil-ki, time of Sennacherib (I R 38: 50), Û-ri-im-me-i (III R 9: 54), and perhaps in a few other Assyrian inscriptions. As would be expected, it is more commonly used in the land Amurru, for in the Old Testament Uri, Uriah, Urijah, Uriel, and Shede-Ur are found, and it occurs in the name Melchior of the Amarna tablets, written Mil-ki-U-ri and Mil-ku-ru. It is found in the name Û-ru-sa-lim (Jerusalem) (see Amurru p. 175). It is found in one of the earliest Aramaic inscriptions, the stele which Zakir of Hamath and La’ash dedicated to El-Ûr (תֵּל מִלּוּן) i. e.

11 Cf. also Ûru-maš Maš (CT 24 10: 8).
12 Cf. Û-rum (CT 25 11: 26).
13 Cf. Û-nin-û Ur (CT 25 1: 8).
14 Cf. Ûr-ûnu Tab (CT 25 20: 17).
15 The name תֵּל מִלּוּן found in a Phoenician inscription at Byblos as has been suggested is the same as 'ûri-nilki (= תֵּל הַר מֵי) defectively written but it contains the name of the deity. It is not improbable that the names
Aporos. But what is more important in this connection than all else, it is the name of the capital of Amurru, familiarly known as ‘Ur of the Chaldees’ (see Chapter X).

To those unfamiliar with Semitic philology it may be difficult to comprehend how this name could appear in these variants, but when it is recalled that the Aramaic was written without vowels, and that some Semites used $m$ and others $w$ to represent the same sound,\(^{16}\) and that a weak consonant like $w$ readily unites with a homogeneous sound and forms a long vowel, the phonetic changes become intelligible. Then also it must be borne in mind that most of our data are found in the cuneiform script, and that for millenniums Amorites poured into Babylonia from Amurru taking with them the name of this deity, which was written differently in different centres by different guilds of scribes (see Chapter I).

Amar, Mar or Uru being an Amorite god, it is reasonable to expect that his consort’s name would be written Amar-tu, Mar-tu, or Ur-tu, like Ashir and Ashirtu, Anu and Antu, Mash and Mashtu, etc.

Recently the writer revived the explanation suggested long ago that Mar-tu, the common ideogram for Amurru, is the feminine of Mar.\(^{17}\) The usual explanation is that it is Sumerian, and means ‘the entering in of Mar’ (the sign $TU$ meaning $erêbu$ ‘to enter’). It is not impossible that Mar-Tu was selected by the Babylonian

\(\mathrm{ArTi}\) (אָרִי) and \(\mathrm{Arêl}\) (אָרֶל) of the Old Testament also contain the name of `Uru (see Amurru p. 157). \(\mathrm{Ari} = \text{Amurru, according to the ancient Babylonian scribe, cf. SAI No. 5328. The ideogram} \mathrm{BUR-BUR} \text{has the value} \mathrm{Uri} = \text{Akkad and} \mathrm{Ari} = \text{Amurru. Whether} \mathrm{Uri} \text{and} \mathrm{Ari} \text{must be considered as related is of course a question; but the raising of} \text{the question cannot be regarded as unscientific, as per Böhl, Kanaanäer, 39 f. See also the discussion in the following chapter on} \mathrm{Ar-data} \text{and} \mathrm{Ar-wada}, \text{also written} \mathrm{El-data} \text{and} \mathrm{Uri-wada} \text{respectively.}

\(^{16}\) Cf. Amurru with ḫāṣ (above referred to), Simannu with $נָס$, Shamash with $שָׁמֶשׁ$, arakhshanna with $עֲרָכָשָׁנָה$, argamunu with $גָּרָמָנוּ$, Nabû-rimannu with $נָבּוֹרִימָנוּ$, etc., a phonetic change well established, as well as the complete omission of the $m$ after it had become $w$ in Assyrian.

\(^{17}\) The Biblical for Moriah seems to show that Martu actually represents a pronunciation. Olmstead has called the writer’s attention to the classical Marathias and ‘Amrit, which seem to show the same.
scribes as an ideogram for the word representing the 'west.' As above noted the Talmudic 'Encra had a related meaning, and is perhaps the feminine of 'Encia.

Some years ago the writer found endorsements scratched and written with ink on Babylonian contract tablets of the Persian period, which contained the name Nin-IB in the Aramaic characters, 'nuṣṭ (מעש), for which it was proposed to read Enmaštu. Fully a score of different explanations have since been offered by nearly as many different scholars.18

Recently the writer had the good fortune to find also the reading of the name in a Syllabary in the Yale Babylonian Collection, which confirms his view that the deity was Amorite, and also that it is connected with Mar-tu = Amurru. The syllabary (MI 53: 288) reads as follows:

ur-ta  IB  u-ra-šu  ša ḏNin-IB šu-ma

This means that the sign IB, called urašu, is to be read ur-ta, and that it is "a name (or sign) of ḏNin-IB." This seems to mean that the complete name is to be read (N)in-urta20 see JAOS 37

---

18 See Amurru p. 196 for a collection of the different readings and interpretations, where the writer suggested an additional and what he regarded a preferable explanation, based on the syllabary:

ma-aš | MAŠ | ma-ašu | ḏNin-IB,

(B. 1778), and the fact that there were gods Mašu and Maštu (K 6335).

More recent views follow: Langdon Liturgies 147 reads Enuršt (Ninuraša); Pognon (JA 1913 p. 411) and Thureau-Dangin (RA XI p. 81) Anušat; Hommel (in Krausz Götternamen p. 59, n. 2) Nin-Nunnuša(?); Maynard (AJSL 34 29 ff.) Ur-ru-da; Albright (JAOS 38 197 ff.) Ninurud or Ninurta which may become Ninurta; and Ninurta, is explained as 'Lord of Armenia' or as 'Lord of Iron.' The latest is that of Luckenbill (AJSL 35 59 ff.), who inquires whether it isn't clear "that Ninurta renders the cuneiform Maštu pronounced, however. Anu-Maštu? That is "the sign usually regarded as determinative for deity is to be pronounced, just as we find it rendered by il in Il-Ba' etc. The writer cannot follow Luckenbill in this since an means 'high,' 'heaven' in Sumerian, and dingir means 'god.'

19 In spite of all Luckenbill has written (AJSL 35 59 ff.), the writer sees no reason for modifying his view on this; see also Chapter XVII.

20 The view was advanced by the writer (JAOS 28 135 ff.) that the first
p. 328), but the initial *n* appears to have been dropped; like Isin from Nisín. Although Inurta, who was unquestionably a goddess originally, became a god in later Babylonia, traces are found showing that her former sex was recognized. In a letter found in the British Museum (Harper ABL 358: 6), and in one in the Museum of the University of Pennsylvania (HAW p. 424) the salutation repeats the name; in the former *d*Nin-IB *d*Nin-IB is written, and in the latter *d*MAS *d*MAS, showing that both the god and the goddess are addressed. Additional proof that *d*Nin-IB or Inurta is to be identified with Amurru or Uru is to be found in the explanatory list of deities.\(^{21}\)

In the Amarna letters there is a place Bit Nin-IB mentioned and also a temple in or near Jerusalem called *d*Bit *d*Nin-IB: showing that the deity was worshipped in that region. One scholar had suggested that Nin-IB is here an ideogram for Shamash, and that the place referred to is Béth-Shemesh. Another has suggested that it stands for Antum, and the name is Béth-Anath. The only basis for these suggestions is that such shrines are known to have existed in Palestine; but this does not appear to have much force. Since Antu was the consort of Anu, Ashirtn of Ashir, Mashtu of Mash, etc., it seems reasonable, as mentioned above, that Urtu(a) should have been the consort of the Amorite Uru. Since the name Jerusalem was written Uru-salim in the Amarna tablets and the same in the Nabataean inscriptions (אﱡسرائيل), there is every reason

two characters of the Aramaic represented the Sumerian *en = ba'äl*. This finds support in the name En-Ur-ta (*CT* 24. 25: 101); but, in the light of the recent find, the prefixed element probably must be regarded as being originally (*n*)in i.e., ba'alat "lady," although after the deity was masculinized and the initial *n* dropped, it may have been construed as *en* "lord"; then since in the late period *r* frequently passes into *š*, In-urta could be pronounced In-uša, which would be reproduced in Aramaic 'nušṭ (נָשָׁת).

\(^{21}\) *d* Ur-ramUru (*PIN*) = Nin-IB ša al-li, *CT* 25 11: 26. Another passage shows that *d*Nin-uru (*PIN*) = Nin-IB, *CT* 25 12: 20: and again that Amurru, written *d*Mar = *d*Nin-IB, III R 57: 81 cd. There can be little doubt but that Nin-Marši (cf. Nin-Marši-ra, Allotte de la Fuye *Doc. Presargoniques* 55: 1, 7), who was so prominently worshipped at Lagash, was another writing of the name. (On Marši see also Chapter X.)
to think that it contains the name of the deity Uru (see Amurru 175 ff.), and it seems reasonable to propose that Bit Šin-IB is the cuneiform representation of a shrine of his consort, which was near the city. That it appears in the Babylonian ideogram which means ba‘alat Urtu, is simply due to the use of the Babylonian language and script at that time in Palestine.

The question arises, where is the habitat of the deity Amurru, whose name was written Amar or Amur, Mar, Mer, Mir, Úr, and his consort Martu (Mashtu) or Urtu. The answer to this question will doubtless point to the imperial city of the great land Amurru (see Chapter X).
Since we are entirely dependent upon data gathered from contemporaneous records of Babylonia for our knowledge of the early existence of Amorite history and civilization, these are first considered.

The Amorites have handed down a list of ten antediluvian kings, corresponding to the ten antediluvian patriarchs. True, they are called Chaldean kings, but they nevertheless are Amorite, the legend doubtless having been brought into Babylonia with the people who migrated from the West. Berossus, who lived in the first half of the third century B.C., wrote three books which he dedicated to Antiochus, king of Syria. Unfortunately, with the exception of a few fragments copied by Apollodorus and Polyhistor, and which were quoted by Ensebinius and Synecellus, his important work has been lost. The antediluvian kings mentioned in these fragments are as follows.¹

1 'Αλωρος, Aloros; ἐκ Βαβυλῶνος Χαλδαίος 10 Saren (36000 years)
2 'Αλαπαρος, Alaparas, Alapors, Alapaunus; filius Alori 3 Saren
3 'Αμηλων, 'Αμιλλαρος, Amlonou; ὁ ἐκ Παυτιβιβλων, ἐκ πόλεως Παυτιβιβλιαν, ex Chaldaei e civitate Pantibiblon
4 'Αμμενων, Ammenon; ὁ Χαλδαῖος, ex Chaldaei e Parmibiblon (Pantibiblon)
5 Μεγαλαρος, Megalanos, Megalarnos; ἐκ Παυτιβιβλων τόλεως 12 Saren
6 Δαωνος, Daως, Da(ν)omas; ποιμὴν ἐκ Παυτιβιβλων 10 Saren
7 Ευεδωραχος, Eυεδωρασχος, Edoranchus, Edoreschus; ἐκ Παυτιβιβλων
8 'Αμεμψινος, Amemphiinus; Χαλδαιος ἐκ Λαραγχων, Chaldaei e Lancharis (Chancharis) 10 Saren

¹ The list is taken from Zimmern KAT² p. 531.

(76)
Zimmern, Hommel, Jeremias, Sayce, Kittel and others, as mentioned in *Amurru* 63 ff., consider that several of the names were translated into Hebrew, and form the list of antediluvian patriarchs of the Old Testament, while others are considered equivalent to Babylonian names. Aloros has been generally regarded the same as the Babylonian mother-goddess Arurur, who assisted in the work of creation. The chief reason why this goddess is considered the same as the first Chaldean king is because she is the 'fashioner of mankind.' Alaporus has been considered to be a corruption of Adapa, which is thought to be the original of Adam. Amillaros or Almelon is said to be the Babylonian amālu, 'man,' which was translated, into the Hebrew, Enosh, 'man.' Ammenon is regarded the same as ummānu, 'workman,' which was translated into Qenan or Cain, 'smith,' although no such personal name as ummānu is known. Megalaros or Amegalarus is considered by Hommel to be Amel-Auru. Edoranchus, the seventh king corresponding to Enoch, seventh in the Hebrew list, has been regarded the same as En-me-dur-an-ki, a mythological king of Sippar, who received revelations from his deity, and ruled 365 years, the same number that Enoch lived. The king Edoranchus, however, ruled 64,800 years according to the list of Berossus. Otiartes has been regarded the same as Ubar-Tutu, and as Atar-hasis (see also Barton A & B 271).

The writer believes that these scholars are mistaken in their supposition that the Hebrew names of the antediluvian patriarchs originated in this way. Although both lists contain ten names, and the tenth in both is a diluvian hero, they seem to have nothing else in common (see *Amurru* 63 f.). The coincidence that the number of years Enoch lived, and the Sippar king ruled, whose name is written in Sumerian *En-Me-Dur-An-Ki*, is the same, is striking,

---

2 Poebel, however, has proposed identification of this name with *LAL-ār-alim-ma* of Nippur. *UMBS* IV 1, 110.
but any relation between the two individuals or their names is scarcely to be regarded as possible. Moreover, since the other names are in a Semitic form, it (Ἐνδοφαραξάν) would be preferable to read it also Semitic, perhaps Ebed-ʿUr ʾahū, i. e., “Ebed-ʿUr, the brother,” namely of the preceding king. Following in the second column are the comparisons and identifications or equivalents that have been proposed by different scholars, and in the third, those offered by the writer:

The fact that the names of these Chaldean antediluvian kings, which the Babylonians recognized as their progenitors, are composed of Amorite name elements besides five or six of them being compounded with the name of the chief Amorite deity, ʿUr̳, is certainly striking proof that the Semitic Babylonian looked upon Amurru as his original home.

From Amurru there went forth peoples who settled Babylonia at a very early time. We are reminded of Genesis: “And it came

---

3 There can be little doubt that Aloros is El-ʿUr̳ (see Chapter VII, etc., also see Amurru p. 64, spring of 1909).

4 Friend or Ox of Uru: cf. מַלָּא a place name (Josh. 18:28): מַלָּא Samaria Ostraca: A-ga-al-Marduk B:1 VI 5 p. 83; Im-me-ir-î-li, ibid. 98.

5 No comment is needed on this identification.

6 Cf. מָלָא 1 Chron. 8:32 etc.

7 Cf. the place name Ar-data along the coast of the Mediterranean, mentioned several times in the Amarna letters, once written El-da-ta (139:5). With this name cf. Ar-wa-da (ibid. 101:13, etc.), once written ʿUr̳(URU)-wa-da (104:42).
to pass, as they journeyed east (or from Qedem) that they found a plain in the land of Shin‘ar and they dwelt there” (Gen. 11:2). Babylonia was ruled during its long history by many foreign peoples, the Amorites, Elamites, Cassites, Assyrians, Chaldeans, Persians, Greeks, etc. It seems from what follows that the Amorites in more than one period conquered and ruled Babylonia.

More than a decade ago the obverse of a fragment of a tablet was published containing the rulers of the Ur and Nisin dynasties (BE 20, 47). The reverse of this tablet has since been published by Poebel. This, together with two other tablets, also found at Nippur in a fragmentary condition, contain the earliest known rulers of Babylonia. It is supposed that when complete the tablets enumerated all the kings from the time of the deluge to the time they were inscribed. The one which was written apparently in the reign of Enlil-bāni, the eleventh king of the Nisin dynasty, records that king as the one-hundred and thirty-fourth from the deluge. The other tablet, it is thought, was written in the time of Dāmiq-ilishu, the last king of that dynasty. (UMBS V 2, 3 and 5.)

The first four kingdoms that have been preserved on these fragments are Kish, Erech, Ur, and Awan. Unfortunately none of the rulers’ names of the last mentioned have been preserved. Prior to the discovery of these tablets, even the existence of the dynasties was unknown. The rulers’ names that have been preserved of the first three, including variants, follow:

8 There are those who hold that they came from the country east of Babel. Most scholars, however, translate miggedem “eastward” or “toward the east,” because of Gen. 13:11. A recently discovered fragment of the Egyptian Sinuhe legend shows that the country east of Byblos was called Qedem; and it is not unlikely that this region is meant as the quarter whence the Semites referred to came, who moved into Shinar.

9 In the period of 1902 years prior to the time of Alexander, Berossus refers to dynasties consisting of 8 Median kings, 49 Chaldean, 9 Arabian, and two others of 11 and 45 kings each (see Meyer, Geschichte des Altertums I 2, 320); but there is no corroboration from the inscriptions of the existence of these dynasties. Olmstead has called the writer’s attention to the fact that in the Armenian translation of Eusebius, which, as is known, ultimately goes back to Berossus, Mar is used in place of the usual Medes, to which Schnable recently referred (OLZ 1911, 19 f.).
THE EMPIRE OF THE AMORITES.

Kingdom of Kish

9. Ka-lu-mu-un (Ga-lu-mu-un) ........................................ 900 years
10. Zu-ga-gi-ib (Zu-ga-ki-ib) ........................................ 840 "
11. Ar-wu-u (Ar-wi, Ar-bu-um), son of a muškinu .................. 720 "
12. E-ta-na (E-ta-na), the shepherd .................................. 635 "
13. Pi-li-qam, son ......................................................... 410 "
14. En-Me-Nun-na (En-Men-Nun-na) .................................. 611 "
15. Me-Lam-Kiški, son ..................................................... 900 "
16. Maš-Sal-Nun-na, son ................................................ 1,200 "
17. Meš-Za-Mug(?), son ..................................................

Kingdom of Eanna (Erech)

Kingdom of Ur

1. Meš-An-Ni-Pad-da ..................................................... 80 years
2. Meš-Ki-Ag-Nun-na, son .............................................. 30 "
3. E-lu ................................................................. 25 "
4. Ba-lu ............................................................... 36 "

The first five names, as well as others, are written in a Semitic form; while the rest are in Sumerian. All that can be said of the first two names, Kalumun "lamb," and Zugagib "scorpion," is that they are Semitic. Ar-wi-u (Ar-bu-um), according to Chiera's Amorite Syllabary, is Amorite. Poebel regards the name Etana as Sumerian, and suggests as its meaning ṝ(d), "the ascender," and anna, "heaven" (UMBS IV 1. p. 112). As a meaning for the name of a human, this would be without parallel. Moreover, this would be a title or epithet, and not the name of a man. It seems to the writer that the name is unquestionably the same as the Old Testament Etan, mentioned a number of times in Chronicles and Kings and in the heading of the eighty-ninth Psalm.10

10 This has been anticipated years ago by Professor Jastrow, see BA III p. 376.
Etana apparently was not of royal origin, for he was called "the shepherd." He ruled all lands": which it is reasonable to interpret as including Amurru. In the epic in which Etana is the hero, which was inscribed in the Assyrian period, there are no earmarks of its having been written originally in Sumerian. The early Babylonian fragment in the library of Mr. J. Pierpont Morgan shows the same. Further, the remark of Shamash, in the epic, to the serpent, "go now and take the road to the mountain," as well as the part played by the eagle, point at least to a mountainous district in which the myth originated. Perhaps Etana, who was a usurper, hailed from the West. Moreover, as mentioned above, his name is West Semitic.

The name of his son and successor, which is read by Barton Pi-li-qam (gam), is also West Semitic. Barton explained the name as being Sumerian, meaning "with intelligence to build" (AB 267). As a meaning for a personal name, this also would be without parallel. It would seem that a comparison with Pĕlĕg of the Old Testament would be most reasonable.11 There are several other names as Pi-la-qu in the Assyrian period, Bu-la-aq-qu in the Cassite, and Be-la-qu of the First Dynasty, that can properly be compared. These words may mean "axe"; but this would scarcely be an appropriate meaning for a child's name. The root palag in Hebrew and Aramaic means "to separate, split." Pĕlĕg, "canal," is a branch stream, which is separated from the main body of water. A child could be referred to as a "branch" or "offspring" of the deity. Names with parallel meanings are common, like Pir'-Amurru, "offspring of Amurru," Baná-ša-Addu, "creature of Addu," Apil-Nergal, "child of Nergal," etc.

It is to be noted that it is highly probable that the names of all the known rulers up to this time, including the ten antediluvian, are Semitic, and also that most of them are West Semitic or Amorite. Following these, most of the known rulers' names appear in a Sumerian dress; but as stated in the introduction, this is no proof that they were thus pronounced. In fact, there are many

11 The writer's attention has been called by Olmstead to Phaliga on the Euphrates, mentioned by Isidore, and the Pallacopas canal, with its survival in Faluja, west of Bagdad.
THE EMPIRE OF THE AMORITES.

considerations that lead us to believe that these early rulers are also Semites.

The last two names of the Kish Dynasty, as well as three in the following two dynasties, are compounded with the name of Mesh (or Mash). This is the name of a deity whose worship was brought from Amurru (see Chapters XII and XVII). The deity En-Me-ir in the name En-Me-ir-Kar appears to the writer to be another form of the name of Ba'al Mer or Amurru (see Chapter VII). The determinative for god is prefixed to the names of the last three rulers of the Ereck Dynasty, who, as is well known, appear as deities in later periods.

The name Shar-bán-da is generally read Lugal-Bán-Da, and regarded as Sumerian. Such names as Ja-wi(mi)-ba-an-da (Ta'anach 3: 13), . . .-ban-an-du (ibid. 4: 13), Mar-ta-ba-an-da in a tablet bought in Aleppo (PSBA 1907, 97), Su-ba-an-du(di) (Amarna Letters) seem to show that it is West Semitic. The fact that the sign meaning "son" was selected to represent the sound ban would alone suggest this. Shar-banda figures as the hero in the legend concerning the tablets of fate which the Zu bird stole from the palace of the god Enlil. There is a distant mountain, also prominently mentioned in this myth, called Sābu.

The two fragments of inscriptions dealing with events of the time of Shar-banda and Dumu-Zi refer to wars with Elam on the east, Halma (Aleppo) to the north, and Tidnum on the west (UMBS V 20 and 21). In the early period Tidnum was a name of the country Amurru; and Halma is to be identified as Aleppo (see Chapter XII). This may be the earliest reference to an invasion of the West, although, as mentioned above, Etana probably conquered Amurru.

Dumu-Zi, the fourth ruler of the Eanna kingdom, is considered the same as the Semitic Tammuz, who in later periods was regarded as the husband or lover of Ishtar. Besides this Sumerian form, the name is written Ta-mu-zu, Du'-u-zu, Du-u-zu, Tam-muz (Hebrew), Thammōza (Syriac), ṭappaω, etc. The general

12 If this is correct, it would seem that the name of an official nu-ban-da, frequently found in Sumerian documents, is also Semitic; in which case nu may have been a determinative = amēlu (CT 12, 35: 1 b).
understanding is that the Sumerian *Dumu-Zi*, which means “true or faithful son,” is the original form of the name. An enlarged form of the name appears as *Dumi-Zi-Ab-Zu*, “faithful son of the deep,” which some think has been suggested by the picture of the sun rising out of the ocean. It is not improbable however, that the two Sumerian signs, of which *Dumu-Zi* is composed, represent the pronunciation of a Semitic name.

The name of Tammuz' mother is written *Si-r-du, and in the eme-
sal dialect, *Ze-ir-tu; which might represent a name like *Sartu* or *Sarah*. Moreover the dynastic text shows that he was a usurper. He is called a hunter or fisherman from the city *HA-A*, probably a city of the land Shubaru. In the Gilgamesh epic, which is pre-eminently Semitic, the goddess Ishtar fell in love with Tammuz; and after his death, which was perhaps premature, she decreed a yearly wailing for him. In the epic, ‘Ishtar's descent into Hades,’ the goddess, in her efforts to restore her youthful lover to life, descends into the underworld. He is referred to also in the Adapa legend as living in the heavenly place. It is not unlikely that Adapa also will be found to be an early Semitic king who had been deified.

The worship of the youthful god who personifies the dying of

13 Poebel has called attention to the name being written *A-H.A* in *BA* VI, p. 675:25, and in *SBH* 80:25, 26; that the city is mentioned in the two texts above referred to, as being destroyed at the time of *Shar-banda* and *Dumu-Zi* (*UMBS* IV 1, p. 117); that in an incantation text (*CT* 15:6) the ideogram is rendered *Shu-ba-ri*, and *Shu-a-a-ra* in the above two texts (in *BA* and *SBH*) which apparently point to the pronunciation *Shuwari* (for *Shubari*): that in II R 57, IV, the ideogram is glossed *tuba; and that in IV R 36, 1 col. I:26-28 there are three cities written with the same ideogram, which in each case was pronounced differently. He concludes that the city referred to was in the southwestern part of Sumer, since in tablets of the Ur dynasty a city *HA-A* is mentioned together with Erech, Eridu and Ur, and in the above incantation text together with Eridu (see *UMBS* IV 1, p. 121). It is not impossible that there was a city of Sumer whose name was written *HA-A; but it is altogether possible that another of the three cities mentioned above, perhaps called *Shubaru*, is here referred to, as indicating the origin of the ruler. Moreover, the city would scarcely have been mentioned, in this connection, if it had been one close by Erech.
vegetation under the summer heat each year, and who in the rising in the spring time brings forth life with him to the fields and meadows, is known to have existed from an early period among the Semites. The yearly observance of the feast of Adonis at such ancient centres as Byblos, in fact, it can be said, throughout the Semitic world, has led scholars in former decades to look upon Syria as the region in which the Tammuz-Adonis myth originated. True, the early form of the name is Sumerian, as stated, as well as that of his father \(^4\) Nin-Gis-Zi-Da (eme-sal \(^4\) Umun-Mu(š)-Zi-Da), and his sister \(^4\) Gestin-An-na; but this is no criterion. The fact that the myth is a common one in the Semitic world; that Tammuz was a usurper from the city HA-A; that he figures in so many other Semitic epics, and legends, as well as in Egypt (see Chapter XIV and Müller EM p. 120), favors a Semitic origin, with the further possibility of a confusion of tales of several individuals to form the Tammuz myth.

In Amurrn. p. 79, and MI, p. 3, the writer endeavored to show that Gis-bil-ga-Mes (Gilgamesh) was a West Semitic name, which contains that of the god Mesh or Mash and that the epic was peculiarly identified with the Lebanon district. More recent researches confirm this, and point to the fact that the mortal combat which Gilgamesh and Enkidu (also a Western Semite) had with Humbaba, took place in Amurrn (see below).

It has been surmised for some years that Gilgamesh was an early king of Erech. The early dynastic list, above referred to, proves this conclusively. Aelian in a fable (De Natura Animalium 12: 21) gives the name of Gilgamesh’s grandfather, on his mother’s side, namely, Semachoros (Σεμαχόρος) which is Semak-Ur, a West Semitic name, cf. Semak-Jau\(^14\) of the Old Testament. He was supposed to be the son of a priest of Kullab, a part of Erech, and Nin-Sun, who was later deified. Unfortunately the name Nin-Sun is in a Sumerian form, but if her father’s name is correctly given by Aelian, she doubtless also bore a West Semitic name, which was reproduced by this ideogram.

It was recognized years ago that the epic in the Assyrian was of a composite character. Naturally it is not impossible that some of

\(^14\) That is Semakoros; cf. also Semakoros.
the tales embodied into the epic were of Sumerian origin, although at the present time this cannot be determined to be the case, as there is nothing in the epic to show that it was originally Sumerian. True, there are a few names like Gilgamesh, En-ki-du, Dumu-Zi, Ubara-Tutu, etc., that appear to be written in Sumerian; but this alone is not a criterion, as mentioned above, that they represent Sumerians.

The name of Gilgamesh's 'double' has heretofore been read as if Semitic, namely, \( ^4Ea(En-Ki)-bani(Dú) \) and \( ^2Ea-tábu(Dúq) \); but more recently scholars have been inclined to consider the name Sumerian, \( ^2En-ki-du \). This reading has been influenced by the word \( en-gi-du \), which occurs in a syllabary.\(^{15}\) There are, however, considerations which make it appear that the name was originally Semitic, like the rulers' names of the Erechian dynasty during which Enkidu lived. This being true, an explanation is in order as to how the name came to have been pronounced in Sumerian.

The discovery of two tablets belonging to a version of the Gilgamesh epic, written about fifteen hundred years earlier than the Ninevite version, which are now in the Pennsylvania and Yale Babylonian Collections, throws important light on several phases of the question under discussion. The former, as shown by the colophon, is the second tablet of the series, and the latter presumably the third.\(^{16}\)

The writing of the name in the Yale and Pennsylvania tablets is \( ^2En-Ki-Dúg \), i.e., "En-Ki or Ea is good", which must have been read \( ^4En-ki-du \), in view of the other readings. This offers no difficulty, as the apocopeation of a final \( g \) is common in Sumerian. In the late Ninevite version the name is written \( ^4En-Ki-Dú \) which means "En-Ki, or Ea, is the builder." Both are common name formations. If the hero was a Sumerian and bore a Sumerian

\(^{15}\) See CT 18, 30:10; also UMBs IV 1 p. 126; and Amurr [p. 81.

\(^{16}\) Poebel, who was instrumental in the Pennsylvania tablet being purchased, published an advanced notice of it in OLZ, 1914, col. 4. Langdon subsequently published the text and a translation of it UMBs X 3. The Yale tablet, as well as a translation of the Pennsylvania, will shortly be published by Jastrow and Clay, in An Old Babylonian Version of the Gilgamesh Epic.
name, we unquestionably have handed down to us a peculiar mixture of elements with different meanings. If, on the other hand, we assume that he was a Semite, and lived at a time when names were written with Sumerian ideograms, and that later, perhaps following a dark period of literary inactivity, the legend was revived when the original meaning and reading of the name were lost sight of, we can understand how this confusion took place. There are reasons for believing that Enkidu (or Ea-tābu) was not only a Semite but that he came from Amurru.

The country whence Enkidu came was mountainous. In the Pennsylvania tablet the following passage occurs concerning Enkidu. The mother of Gilgamesh, in speaking of Enkidu, says: "Some one, O Gilgamesh, who like thee is born in the plain, and the mountain hath reared him, etc." In the Yale tablet this passage occurs: "Enkidu opened his mouth and spake to Gilgamesh, 'Know, my friend, in the mountain when I moved about with the cattle to a distance of one double mile of the territory of the forest, I penetrated into its interior to Huwawa, etc.' " Several passages in the Ninevite version also show that Enkidu came from the mountains. "Ere thou camest down from the mountains Gilgamesh beheld thee in a dream." Again, "Then came Enkidu, whose home was the mountains, who with gazelles ate herbs, etc." The fragments of the Ninevite recension which King published (PSBA 1914, 64 ff.), in which Gilgamesh, who was apparently wounded, is advised to entrust himself to Enkidu’s guidance through the cedar forest, read: "Let Enkidu go before thee. He knows the path through the cedar forest. He is full of battle, he shows fight. Let Enkidu protect his friend; let him keep his comrade safe." These and other passages show that Enkidu hailed from a mountainous district, which contained cedar forests.

It is interesting to note that Dr. William Hayes Ward’s studies of the art as displayed by the seal cylinders depicting Gilgamesh and Enkidu led him to believe that the myth preserved the memory of its origin, not in the low swamps of Babylonia, but in a land of hills and forests (Seal Cylinders, 62 ff., 414). He observed that Gilgamesh in the early cylinders fights a bison, an animal of the mountains and more formidable than the lion, but that later the Babylonian artists affected the water buffalo of their
own region. Enkidu, he also noted, always retained the horns of the bison. In one cylinder (No. 177) containing the Gilgamesh motif, Ward called attention to a cypress tree growing on a mountain. The art therefore as well as the passages quoted above indicate that Enkidu had come from a mountainous district.

In this connection, it might be mentioned also that in the art of the seal cylinders, Enkidu though not as tall in stature, is always represented as a duplicate of Gilgamesh. This is admirably illustrated by a terra cotta relief found in the Yale Babylonian Collection (see *Art and Archaeology* p. 73). This would make it seem scarcely probable that one was a Semite and the other a Sumerian. Moreover, they both have curly hair, and wear beards, which is characteristic of the Semites as portrayed in Babylonian art.

The story of the long journey that Gilgamesh and Enkidu made to the cedar forest, which surrounded the stronghold of Humbaba, has been supposed by most scholars to refer to Elam. The reason for this view has not been that cedar forests are known to have existed in that region, but because the name Humbaba had been identified with the Elamite god Humba (also written Hamba, Humban, Umman, Umba, Amba, etc.). This has been done in spite of the fact that the name of the individual Humbaba, or Hubaba, only slightly resembles the name of the Elamite deity; for in every instance known the name of the former is written with the final consonant doubled, while the latter is not.

The name Humbaba unquestionably is Amorite, and not Elamite. This is definitely shown by the form of the name on a tablet belonging to the Gilgamesh epic in the Yale Babylonian Collection. In the Amorite Syllabary published by Chiera, there is a name written Ḥu-wa-wa (ḪU-PI-PI). This name occurs also in the Ur Dynasty tablets. And it also occurs in an omen, following one which mentions Ḥu-um-ba-ba (CT 28 6: 3-4). In the Yale Gilgamesh tablet the name is written Ḥu-wa-wa, the same as in the Amorite Syllabary. This as well as other reasons make it perfectly reasonable to conclude that the cedars referred to are those

---

16 BE 3 11: 12; 147: 5, HLC 1, 22, 26, etc., in Omen texts. CT 28, 21: 8 etc.
of the Lebanon district, which has frequently been suggested;\textsuperscript{17} and which also prove that the name is the same as Kombabos (\textit{Kopβαβος}), who appears as the guardian of Queen Stratonike in the legend concerning the construction of the sanctuary at Hierapolis (Lucan \textit{De dea Syria}), with which name Humbaba has frequently been compared. Moreover, the name is actually found also in the Old Testament Hōbab,\textsuperscript{18} the son of Reuel (Numb. 10: 29, Judg. 4: 11, etc.).

In the omens, the name Huwawa suggests a monster.\textsuperscript{19} Two of the omens read: “If a women gives birth to a Huwawa, the king and his sons will leave the city. If a sheep gives birth to a lion with a face of a Huwawa, the prince will be without a rival, and will destroy the land of the enemy.”\textsuperscript{20} In the epic the name of this Amorite despot, “whose roar is a deluge, whose breath is death,” has the determinative for deity, the same as the name Gilgamesh (which is written “\textit{Gis}”) and Enkidu.

Since it is reasonably certain that the cedar forests of Humbaba were those of Amurru, and this is the region whence Enkidu came, it is highly probable that the latter also was an Amorite. This being true, there can be little question that the Sumerian form of his name, as above, represented a Semitic name, which may have been Ea-tōb. This would appear very reasonable, especially if the contention of Chiera that Ea is a West Semitic god should prove correct. Jastrow would now propose the reading Ba’al-tōb as the Semitic original of the name; that is, \textit{En-Ki} “lord of land” represents the West Semitic \textit{Ba’al}.

As stated, the epic is not only Semitic, but there are many elements which show connections with the Western Semites, such as the gods Girra, Urra, Adad, Irnini, Antu, etc., and personal names such as Atraḥasis, Buzur-Amurru, etc. Whether Gilgamesh, who

\textsuperscript{17} Gressman, \textit{Das Gilgamesh-Epos}, p. 111, f. 1; Poebel \textit{UMBS} IV 1, p. 224; and Jastrow, \textit{Sacred Books and Early Literature of the East} I, p. 193.

\textsuperscript{18} Hūbabā = Ὅμβαβα = Ὅββαβα = Hōbabā.

\textsuperscript{19} The passages where it occurs are \textit{CT} 28, 3: 17, 4: 89, 6: 3-4, 14: 12, 21: 28. I am indebted to Professor Jastrow for these references.

\textsuperscript{20} In the passage \textit{CT} 28, 6: 3-4, both the early and late forms of the name appear.
was a usurper, was from the West, or not, remains to be determined. If he were, the question arises, what was his western name?

In Amurru, p. 79, the endeavor was made to show that the name which became contracted into Gilgamesh means "the axe of Mash" (see also MI p. 3 n.). Such a name, however, would scarcely be appropriate for a child. How is it to be explained? It is possible to offer several conjectures; but let the following suffice. The hero's name may originally have been Bilg-Mash or Pilig-Mash, and meant "the offshoot of the god Mash." Such formations and meanings are very common (see the discussion on Pêlêg, above). In later years, after he had become the legendary hero, to whom were attributed the exploits of Enkidu, and perhaps others, as is shown from the Pennsylvania tablet, his name was etymologically interpreted in accordance with the reputation he had acquired just as is done in the Old Testament in the case of Abram and others. It is only necessary to read the epic to see how frequently the axe (or spear) is mentioned; it doubtless played an important role as his weapon. In consequence, when in later times the legend was committed to writing it was merely necessary to place the determinative giš before Bilga. Still another, and perhaps more simple explanation of the name might be, that it means "Gish is an offshoot of Mash." Unfortunately the significance of Gish which figures so prominently as an element in names, is not altogether clear; though the equivalent idlu "hero," offers a point of departure. Moreover, these are only tentative explanations of this difficult name, which are offered with considerable reserve.

The earliest Amorite king, who by his inscription informs us that he had conquered Babylonia, is . . . -um-Shamash, king of Mari, and Patesi-gal of Enlil, which means that he was suzerain

---

23 On the element Mash, Mesh, etc., see also Chapter XVII.
over the land. His inscription belongs to a very early period; see further Chapter X.

A number of the rulers' names in the very early dynasties are Amorite; for example, I-su-il of the Opis dynasty, El-muti of the Kish. Doubtless all the rulers of these two dynasties were Semites whose ancestors had come from Amurrnu. Eannatum, *patesi* of Lagash, records in one of his inscriptions the coalition of the Amorite city Mari with Kish and Opis against him, which he defeated; see further Chapter X. Lugal-zaggisi, the son of Ukush, as mentioned, is considered by some to be a Semite. The tradition concerning Sargon's origin is that he was born in "Azupiranu which lies on the bank of the Euphrates." The great conqueror of Elam and Barahsu, Urn-mnsh, bears an Amorite name. The obelisk of Manishtusu of the Kish-Akkad dynasty contains an especially large number of Amorite names. They are compounded with the names of Adda, Mir-Dadu, Mir-Shar, I-Iu-Me-ir, Ba' al, Bar-ra, perhaps Malik, etc. Contracts of this era are known, but unfortunately Sumerian being generally the language in which they appear, most of the names are written with Sumerian ideograms, which make it in most cases impossible to determine whether they represent Sumerian or Semitic names. Such a document, however, as the Obelisk, which is written in Semitic, gives reasons for believing that many Amorites lived in the land. Recently Scheil published a cylinder seal belonging to the period of the first kings of the Kish-Akkad dynasty, which bears the name of Is-re-il, son of Rish-Zuni, and which he equates with the Hebrew name Israel.

More than a decade ago the writer advanced the idea that the rulers' names of the Nisin dynasty seemed to show that many of them were Amorites (*JAOS* 1907, p. 8). The name of the founder, namely, Išbi-Urra, also another containing the same deity, namely, Urra-imitti, as well as others compounded with the names Dagan and Ishtar, pointed to this conclusion. Recently Barton published an oracle which shows that Ishbi-Urra, the founder of the dynasty, came from Mari on the Euphrates (*MBI* 9: 4, 22), thus confirming the view that the rulers were West Semitic. As mentioned above (note 9), the Armenian translation of Eusebius calls the eight
rulers of this period Amorite (Mar), instead of the usual "Median." A date formula of a tablet belonging to the reign of Libit-Ishtar of the Nisin dynasty seems to point to an interruption of the dynasty of Ishbi-Urra by another Amorite named UR-Inurta.  

The Larsa dynasty, which was founded about the same time as the Nisin dynasty (see MI p. 41), was also Amorite, as is shown by the names of the rulers. The Larsa dynastic tablet recently discovered in the ruins of that city, and now in the Yale Babylonian Collection, reads:

21 years Na-ap-la-nu-um  
28 years E-mi-su  
35 years Sa-mu-um  
9 years Zu-ba-a-a  
27 years Gu-an-gu-na-um  
11 years A-bi-sa-ri-e  
29 years Su-mu-ilu  
16 years Nu-ur-Ammer  
7(?) years dSin-i-din-nam  
2 years dSin-i-ri-ba-am  
6(?) years dSin-i-qi-sa-am  
1 year Sili-(li)-Ammer  
12 years Warad-dSin  
61 years dRi-im-dSin  
12(?) years dHu-am-mu-ra-bi  
12 years Sa-am-su-i-du-na, king  
259 years.

24 This date formula (CT 4, 22) has been the subject of considerable discussion. Ranke read it: Mu ša Li-bi-it-Istar A-mu-ra-um it-ru-du-us "The year in which the Amurru drove out Libit-Ishtar" (OLZ 1907, 109 ff.). Meissner translated it: "The year in which the city Amurru drove out Libit-Ishtar" (ibid. 109 ff.). Ungnad translated it, "The year when Lipit-Ishtar, the Amorite, was banished." From the Ur-Nisin dynastic list it is clear that Libit-Ishtar's successor did not belong to the ruling family. King suggests the date means that the Amorites who overthrew the king were dislodged by UR-Inurta, who retook the city and established his own family upon the throne (SA p. 315). It is not unreasonable to maintain that UR-Inurta was an Amorite, perhaps from another quarter than that whence Ishbi-Urra, the founder of the dynasty, came.
Thureau-Dangin in a recent number of the *Revue d’Assyriologie* has published an important rectangular prism, now in the Louvre, which, if perfect, would have duplicated almost completely the above, giving at the same time the formulae for all the years beginning with Gungunn. The above list fortunately gives the number of years which are broken away from the Louvre prism, and it supplies the names of the rulers with the number of years they reigned from Abi-sare to Warad-Sin.²⁵

Some interesting observations are possible in connection with these dynastic lists and what has been said above. We had no knowledge of the first four reigns, and also of others in the list from any source prior to the discovery of these important records, although Naplanum ruled 21 years, Emisu 28, Samum 35, and Zabaia 9. These names, as well as others that follow, are Amorite. The time they ruled, namely, almost a century in length, is, therefore, one of those dark periods of inactivity, mentioned above. Even the date formulae apparently were unknown when the Louvre prism was inscribed, for they begin with the reign of Gungunn. This king is mentioned in the date formulae of the contracts that have thus far been published; and he is also the first of the dynasty who is mentioned in other known inscriptions. Enannatum, a son of Ishme-Dagan of Nisin, who was chief priest at the city of Ur, has handed down inscribed clay cones, in which he records the rebuilding of the temple of the sun-god at Larsa for the preservation of his own life and that of Gungunn, the king of Ur (SA 310 ff.). This ruler, in a brick inscription, in which he commemorates the building of a great wall at Larsa, calls himself king of Larsa as well as of Sumer and Akkad. The cones show that he also ruled Ur.

²⁵ The Yale tablet contained the same inscription on both sides, but with the exception of a few characters on the reverse, which happen to be very important in restoring the figures on the obverse, that side is broken away. Unfortunately the numbers on the obverse also have suffered, yet it can be restored nearly completely with the aid of what remained on the reverse. For a full discussion of the Larsa date formulae see Thureau-Dangin RA XV 1 ff. and Grice *Chronology of the Larsa Dynasty* (YOR 4, part 1).
Since the first four rulers of this dynasty have left no traces of their rule, except in the dynastic tablet and prism, perhaps they sat on thrones far removed from Larsa, somewhere on the Euphrates. The fact that their reigns were not of short duration shows that they were not feeble rulers.

It has been held for many years by Hilprecht that there was active hostility against Babylonia on the part of Elam at this time, when UR-Inurta ("Nin-IB) usurped the throne of Nisin. But there is no justification for supposing an Elamite invasion at this time. It is, however, highly probable that the evidences of vandalism which Haynes, who excavated Nippur, had observed beneath the pavement in the temple of UR-Inurta were caused by the Amorites, either when the dynasty was established or possibly when a fresh invasion of Amorites displaced those who had preceded them. Gungunu of the Larsa Dynasty was an Amorite, as the Amorite Name Syllabary shows. His reign synchronizes with the long one of UR-Inurta. It is not impossible that both were usurpers and represented a fresh influx of Amorites. Decades later the Elamites did appear on the scene, when Warad-Sin, followed by Rim-Sin, sons of Kudur-Mabug, displaced the Amorites at Larsa, and brought the Nisin dynasty to a close.

The dynasty of Babylon, usually known as the First Dynasty, began to rule shortly after the close of Gungunu's reign (III p. 41). The kings of this dynasty, as mentioned above (Chapter II) were also Amorite.

Not only is the nomenclature of this period full of Amorite names, but many bearing Semitic Babylonian names were devotees of Amorite deities, as is shown by the impressions of the seals on the tablets. This would imply that many of the Amorite names were very likely Babylonized, which is understandable, as in many instances it only involved a very slight change. This would indicate that the Amorites were much more numerous than the nomenclature shows. But what is especially significant is the large number of the devotees of Amurru, El-Uru, Adad, Nergal and other Amorite gods, as indicated by the seals, not only from one site, but from all whence tablets have come, Babylon, Sippar, Larsa, etc. From the seal impressions on recently published texts coming from Larsa, it would almost seem as if the chief deity of the people was
Uru or Amurru. Even Rim-Sin, the Elamite, has handed down a votive tablet in which he acknowledges doing obeisance to El-Uru the god of the Amorites, in dedicating a votive inscription to him (Yale Babylonian Collection, No. 7232). In short, the land was filled with Amorites.

The name Ishki-Bal and others in the Sea-land dynasty may also prove to be Amorite; but thereafter Amurru does not seem to have figured very prominently in the affairs of Babylonia, except as a field for gathering tribute. Doubtless, the brief Elamite suzerainty of the West, followed by that of Babylon, was responsible for the disorganization which ensued.
EARLY BABYLONIANS IN AMURRU

The records of Babylonian and Assyrian kings which show contact with Amurru are naturally important for the reconstruction of the history of that land. These show us that already in the earliest known period of Babylonian history the great rulers of that land were preying upon the Amorites. As is evident also from what has preceded and what follows, the people of Amurru, especially from the middle Mesopotamian district, also had their turn in such undertakings.

Etana, the twelfth king of Kish, as referred to in the last chapter, is said to have subdued (ruled) all lands. This expression, which is found in a tablet written in the time of the Nisin dynasty, doubtless meant that the lands of the West were included. It seems reasonable, therefore, to look upon Etana as the first known ruler who came into contact with Amurru. The same is true as regards the two fragmentary tablets, dealing with events in the time of Shar-banda and Dumn-Zi, which refer to wars against Elam below, Ūalma above, and Tidnum in the west. Also the conflict of Gilgamesh and his companion Enkidu with Humbaba has been noted. Humbaba is perhaps the earliest Amorite known by name, except the legendary antediluvian rulers handed down by Berossus.

Lugal-zaggisi, king of Erech, informs us that he conquered the lands “from the sea, the lower, the Tigris and Euphrates to the sea, the upper (i. e., the Mediterranean).” For years it has been known from late omen texts that Sargon, after several campaigns, subdued the land of the Amorites, and set up an image of himself on the Syrian coast. In an inscription recently published (UMBS IV 1, 177 b), which gives legends from monuments seen in Nippur, the god, presumably Enlil, is credited with having given unto Sargon “the upper land Mari, Iarmut, and Ibla even unto the Cedar Forest and the Silver mountains.” The city or kingdom of Mari was on the Euphrates (see Chapter X ); Iarmut, as shown by the Amarna letters, was a seaport town on the Phoenician coast; and
Ibla, mentioned by Naram-Sin and also by Gudea, was the district further north. The cedar forests, it would seem from the description, were north of Ibla, and therefore likely refer to the cedars of the Amanus district, which Gudea mentions in his inscriptions. The silver mountains, it is thought, are in the Taurus range, the same referred to on the obelisk of Shalmaneser.  

In the omens of Sargon there is a passage frequently quoted which reads: "the sea of the West he crossed," which has been interpreted as meaning the Mediterranean. But a chronicle more recently published by King proves that the eastern sea is meant. The passage reads: "The sea in the East he crossed, and in the eleventh year the country of the West in its full extent his hand subdued" (Chron. II, p. 4). The above inscriptions taken from his monuments show the extent of the West land which he conquered.

A clay tablet recently discovered at Amarna (Y8 XII, 193), the translation of which was published by Sayce (PSBA 1915, 227 ff.), contains a legend of Sargon's successful invasion of a distant country separated by a barrier of trackless forests and mountains. Sayce holds that this was in the Hittite region in eastern Asia Minor. The tablet he thinks belonged to a Hittite resident of Amarna of the period to which the so-called Amarna tablets belong. In a date of Shargani-Sharri, we learn that ruler conquered Amurru. It reads: "In the year in which Shargani-Sharri conquered Amurru in Basar."

Gudea on his statue as an architect informs us of his extensive building operations, and how he secured his materials from mountains in Amurru, Arabia, and the country north of Amurru. From Mount Amanus he brought cedars, and urkarinu wood. From Ursu in the mountain of Ibla, he brought zabalu, and ašuḫu wood, and plane trees. From the mountains Umamu in Memnu, and Basalla (perhaps Mt. Bazara mentioned by Shargani-Sharri) in Amurru, he brought stones, out of which he made stelae. From

---

1 See Poebel, ibid. 224 ff. Olmstead thinks the mines at Bulghar Maden are here referred to (AJSL 33, 311).

2 Cf. Thureau-Dangin RTC 124. This place has been identified with Mt. Bisrur, mentioned in Ashur-naṣir-pal, III 9 ff. and the modern Buzera near Circesium. If this is correct, it would indicate that in this period this part of the land was included in Amurru.
the mountain Tidanu in Amurru, he brought marble; and from Kagalad, a mountain of Ki-Mash (Damascens), he brought copper. From the mountains of Mehlija, he brought nusū wood; and gold dust from the mountains of Ḫahun. From a mountain in Gubin, he secured ḫulpūn wood; from Madga asphalt, and from the mountain Barshib, nálua stone. From the lands of the lower country by the Persian Gulf to the upper country of the Mediterranean Sea, as well as other places, he transported materials for his building operations and statues. In the absence of any military records of Gudea, we know only what the contributions of these lands were in building materials.

Dungi in his year dates commemorates the devastation of different cities in the west, as Humurti (probably Gomorrah), Ki-Mash (Damascens), etc. Unfortunately, many of the cities which Dungi conquered cannot be identified. Together with the other rulers of the dynasty who followed, namely, Amar-Sin, Gimil-Sin, and Ibi-Sin, he used the title "king of the four quarters of the world," which it is understood included Amurru. On the seal impression bearing Ibi-Sin's name found on a Cappadocian tablet, see Chapter XIII.

Elam held the suzerainty of Amurru for a time. Kudur-Mabug, the father of Warad-Sin and Rim-Sin, used the title Ad-da₄₄k₃₄r₃₄Ma₄₄tu, "Suzerain of Amurru." That Elam held sway in Palestine is confirmed by the tradition handed down in the fourteenth Chapter of Genesis, which informs us that in the days of Amraphel, Chedorlaomer (Kudur-Lagamar), king of Elam, invaded Palestine. It would seem that Elam had gained ascendancy in this region about the time it did over Larsa in Babylonia when following a succession of short reigns the sons of Kudur-Mabug, Warad-Sin and Rim-Sin, were placed on the throne of Larsa.

Hammurabi in conquering Elam in his thirty-first year, and Mari in his thirty-fifth year, acquired the title to Amurru (see Chapter X). In a stele found at Diarbekr in Southern Armenia (LIH I 66) he calls himself "King of Amurru." Whether at this time Amurru included this part of the Near East cannot at present be determined.

Hammurabi's son and successor, Samsu-iluna, in the date formula for his thirty-sixth year, refers to the great mountains of
Amurru (CT 2, 27:18). Only one other ruler of the same dynasty, Ammi-ditana, the great-grandson of Hammurabi, refers to the land in his title "king da-ga-mu of the land Amurru" (LIH I 100:6), which term is not understood. In the Cassite period, which followed, contact with Amurru is unknown, except the bringing back from Hani of the images of Marduk and Šarpanitum.

Contact on the part of the kings of Babylonia with Amurru seems to synchronize with highly prosperous reigns. When invasions or conquests of Amurru, Elam and Subartu took place, it was usually at a time when Babylonia was strong and vigorous. These were periods when art flourished, and the scribe was much in evidence. Monumental records or victory steles seemed to be the order. When all the lands, or the lands from the lower sea to the upper, were conquered, including Elam, the ruler used the title, "king of the four quarters of the world." The title enjoyed by kings in reigns immediately preceding or following such, is frequently "king of Sumer and Akkad," which embraced simply the northern and southern part of Babylonia.

Between these periods which offer evidence of high water marks of what were regarded as prosperous times, there are dark periods when the civilization was apparently at a low ebb. Even temple records in these periods do not seem to have been kept; in fact, evidences that there were scribes in some of these eras are almost completely wanting, though naturally this could scarcely have been the case. Prior to the time of Lugal-zaggisi, and the period following the reign of Shargani-Sharru, there are great gaps in the history. Following the overthrow of the Ur Dynasty, when Amorites began to reign in different centres, there was apparently a chaotic state of affairs for nearly a century, as the almost complete absence of records shows. In the first half of the Cassite rule, as far as is known at present, there was again such a lull. The same is true during the greater portion of the period when the Assyrians were dominant.

As a rule the monuments of Babylonia throw no light on the question as to what was the cause of the low tide of civilization in these periods. The conqueror did not record what led to the overthrow of the native dynasty. He was not in a position to flaunt before the conquered people the fact that he had subjugated them
The presence of foreigners upon the thrones must explain for us what happened. The kings who sat on the thrones being Amorites, Elamites, Gutians, Cassites, etc., we can only infer that the tables had been turned for the time being upon the Babylonians. We are often dependent, for what we know of them, upon the effort of the later scribe who handed down to us dynastic lists; but many of these are unfortunately so fragmentary, especially for the early periods, that we are still in the dark even as to the length of many of these eras of depression. An occasional historical reference as to what occurred may be found in later periods, as for example, we are informed in a chronicle that Agum-kakrime brought back to Babylon from Hani the cult-images of Marduk and Šarpanitum, and installed them in their shrines; or Ashurbanipal, in recording his defeat of Elam, celebrates his return of the statue of Nanâ to her shrine in Erech, which he informs us was carried off to Elam by Kadur-Naḫundi, 1635 years earlier, but additional knowledge of the invasions is wanting.

If we were able to delve among the records of the powers whose representatives sat upon the throne of Babylonia, perhaps we would know more about the state of affairs that led to the overthrow of the rule. The resurrection of Elam’s royal records, those of Amurru, Guti, Shubartu, etc., will enable us to fill up some of the gaps in the early history of Babylonia. They, doubtless, will also show how these countries held sway over Babylonia at times of which at present we have no intimation whatever. A country like Amurru, which was overrun and plundered many times throughout the millenniums of its history, certainly, especially in the early period, was strong enough to strike back. The divination texts would alone be sufficient to show that the fear and dread of this being done were ever before the peoples of Babylonia. It is only necessary to examine these texts to ascertain how deeply seated was this fear. Since the Amorites were quiescent after 2000 B. C., we must conclude that the divination formulæ portending trouble from this quarter came from an earlier period. Moreover from the evidence we already possess, there can be no question but that trouble from the West occurred repeatedly; and it is certainly reasonable to infer that when fuller dynastic records have been recovered this fact will become more and more evident.
X

UR THE CAPITAL OF AMURRU

It has been customary to look upon the political life of Amurru, especially of the early period, as more or less devoid of cohesion or unity. The fact is, Amurru is generally regarded as made up of petty princedoms of semi-enlightened people, or tribes of a semi-barbarous character. This conception has been favorable for the development of the pan-Babylonists’ theories, and for the view that all Semites are Arabs; but this is erroneous, for the early period as well as the late, and must be abandoned. The country embraced such peoples who had a low order of culture, especially in certain regions, as for example Palestine, which, with its varied geographical character and being more or less isolated, was a home of neolithic man as well as a harbor for representatives of many nations. Nevertheless there are abundant reasons for believing that even this region had its large quota of civilized people; and as regards the country as a whole, it will be shown as we proceed that it enjoyed, politically and otherwise, a civilization comparable to that of its neighbors.

Whenever light is thrown upon the political situation in the post-Amorite period (i.e. after 2000 B.C.) by contemporaneous records, we learn of kingdoms of a greater or less extent. The inscriptions of Thutmose III (1501-1447 B.C.) furnish us with the earliest knowledge of political affairs in Amurru in this post-Amorite period. At this time, the king of Kadesh is either the head of an alliance of Amorites which included Palestine, or he is suzerain over this region (see Chapter XIV). In the Amarna period, Abdi-Ashirta, who was recognized by Egypt as an overlord of the Lebanon Amorites, and Aziru his son, created with the assistance of the Hittites an Amorite kingdom (see Chapter XII). We have knowledge also of Og and Sihon, kings of the East Jordan Amorites. A few centuries later the Hebrews under Saul aspired to found a kingdom; which under David and Solomon embraced, with the
X. UR THE CAPITAL OF AMURRU.

The greatest political ascendancy in Western Amurru that is known in post-Amorite times was that of Jerusalem before the kingdom was divided and fell a prey to Assyria and later to Babylonia. Without the indigenous record that we have in the Old Testament, we should know absolutely nothing of the kingdom of David and Solomon. Egypt, Assyria, and Babylonia, at the time when the Jews founded their kingdom, were comparatively weak; and were absorbed with their own problems at home, which permitted the Hebrews to develop their kingdom. There were many such periods in the history of Babylonia, especially in the earlier millenniums, when powerful kings could have ruled the length and breadth of Amurru; and of whom we shall learn as little in the annals of Babylonia, even when all have been brought to light, as we have in later times of Solomon and David. Early Egypt also had its periods of decline, for which it is not at all improbable that some mighty Amorite rulers were responsible. In short, a great and powerful hegemony in Amurru could have existed in the very periods on which contemporary records in Egypt and Babylonia are silent, or in which no annals were produced; and it is only by the help of isolated statements, perhaps of a later period, or by the study of the personal names, that it can be ascertained that the cause of the decline was due to the encroachments of some powerful neighbor. It would be reasonable to infer, having alone the knowledge of these kingdoms, alliances, and coalitions, that

breasted, however, thinks, on the basis of 1 Kgs. 9:16, that Solomon was evidently an Egyptian vassal, who possibly received in marriage a daughter of the Pharaoh, and whose territory his Egyptian suzerain extended by the gift of Gezer, which the Canaanites had not conquered, but which he captured, burned and presented to Solomon. IE p. 529.
Amurru, which land was so favorable for an advanced civilization, prior to the time that it succumbed to Elam and Babylon, played an important rôle among its neighbors. But there is no need to rely upon inferences for this view, since there is proof that it is fact.

The land Amurru like every other kingdom had a centre from which it was governed. In searching for this imperial city it seems that certain considerations must be kept in mind. In the first place it would seem reasonable to look for a city that bore the same name as the kingdom, having in mind such lands as Ashur, Mash, Akkad, Tilla, Babylon, etc. It would appear that the city should have existed at a very early era to account for the name Martu—Amurru being used for the land in the early periods. The city doubtless occupied a position rather centrally located to have maintained its dominance over this wide area, and also to have influenced Babylonia so extensively. Such a city it would seem, having conquered all the surrounding kingdoms, and occupied such a prominent position, must have practically passed out of existence, for little is known about it in the late centuries. The city probably was the home of the god whose name was written Mar, Mer, Amar, Uru, El-Ur (Aloros), etc., and who figured so prominently in the early nomenclature of the Babylonians. With the loss of its prestige in the latter part of the third millennium B.C., Amorite influence upon Babylonia practically ceased: the city's religion must have waned, for subsequent to the time of the First Dynasty of Babylon, Amorite names compounded with Mer, Mar, Amurru or Uru are rare in comparison to earlier periods; in fact some of the writings of the name totally disappear in personal names, although they are preserved in the late period in the syllabaries.

The writer has shown that Amurru, which is written in Aramaic Uru (אֲמוּרָע), is identical with the name of Abraham's home, Ur of the Chaldees, i.e. Ur (אֲמוּרָע). Its position in history, like that of the kingdom of Amurru, was practically lost sight of. So little was known of the city that the Jews in Babylon in Talmudic

See Amurru 167 ff. Since the name Amurru or Uru was regarded the same as Ur, the writer proposed the identification of a place near Sippar as the site of the city; this view is now abandoned.
times and some later Arabian writers regarded Warka (or Erech, Gen. 10: 10) as the city. It now seems highly probable to the writer that the centre sought for as the imperial city, or Amurru, is the place known as Ur of the Chaldees.

Recently Olmstead revived an identification which he credits Henry Rawlinson as having made from a topographical point of view, namely that of the city Amurru with Marathas, which appears on the sea coast opposite Arvad.\(^3\) Olmstead, regarding this the capital, sees the name also in the river Marathias of Eustathias, \textit{ad Dionys.} 914, and in the modern ‘Amrit (\textit{J. AS} 38, 249). In the Amarna Letters the kingdom formed by Abdi-Ashirta in this region is called Amurru. The Boghaz-köi archival tablets, as well as the Egyptian inscriptions of this period, also use the old name of the empire. Probably the name Marathias and ‘Amrit have come down from this period. The ‘city of Amor’ mentioned by Ramses III (1198-1167) may be this city. In the Assyrian period Amurru seems to have been confined to this district; and it is perfectly natural to look for the old capital in this region: in fact, the present writer has heretofore inclined toward this view. More recent investigations, however, seem to point elsewhere as the region of the old capital which gave the land its name, and especially since we have many references to the Mediterranean cities in the early inscriptions of Babylonia and Egypt (see Chapters IX and XIV), but not the slightest evidence of the city in question in the period when the empire existed, namely, in the third and fourth millenniums B.C. Such an argument is always precarious, but nevertheless until evidence is found it appears to the writer that it is reasonable to look elsewhere, in the light of other facts, for the ancient and important city which was powerful enough to rule the land from the Mediterranean to Babylonia.

The earliest kingdom in the Mesopotamian region of which at present we have knowledge is that of Mari or Meri, along the Euphrates. The city played an important rôle in the early history of Babylonia, and very probably of the entire North Semitic world.

\(^3\) Rawlinson says: ‘‘In the Khorsabad Inscription, for Akarra or Acre is often substituted Maratha which is of course Μαράθης of Strabo 'ζωος ἄφρατα Φωίκων' Lib. 16. 518.’’ (\textit{JRAS OS} 12, 430 n. 1.)
The earliest known reference to the city is on a votive statuette in the British Museum written in archaic script, which reads as follows: “. . . -um-Shamash, king of Mari, great patesi of Enlil, . . . to Shamash presented as a gift” (CT 5, 2). The title patesi-gal "Enlil shows that this early king of Mari was suzerain over at least part of Babylonia. It seems to the writer that this scarcely noticed text is of the greatest importance in that it is the earliest known inscription of an Amorite, and refers unquestionably to one of those early periods when Amurru was the dominant power in Babylonia. The style of the sculpture, which is archaic, points to the earliest age, probably as early as the statue found by Banks at Bismāya (King S.1 97). The character of the writing also points to a very early age. The writer finds no reference to its provenance, but a photograph of the statuette has been published (ibid. p. 102).

Eannatum, an early patesi of Lagash, informs us that in his day Mari was allied with Kish and Kesh (Opis) against him (1'B I 22, VI: 22). The coalition of these cities with Mari is interesting in this connection because they are Semitic centres. Eannatum claims to have administered a crushing defeat to the confederacy led by Zazu of Kesh, at the Antasurra of Xingirsu, and to have pursued them to their own city. He does not mention, however, that he conquered Mari.

Sargon, king of the Kish-Akkad dynasty, refers to the capture of Mari. He informs us that some deity whose name is missing, probably Enlil, "gave unto him the upper land, Mari, Larmutu and Ibla as far as the cedar forest and the silver mountains" (UMBS IV 7, 179 f.). In an oracle of Ishbi-Uzza, as noted in Chapter VIII, the founder of the Nisin Dynasty, that king is twice called "the man of Mari." We have also seen that not only the Nisin rulers bear Amorite names, but those of the contemporaneous dynasties, namely Larsa and Babylon; which, considered in connection with the fact that the nomenclature at this time is filled with Amorite names, show great influence from this quarter (see Chapter VIII).

To this period very probably belongs a votive tablet, now in the Louvyrê, which had been inscribed by a king whose name has also unfortunately been injured. It reads as follows: "Zi-[ḫm- . . .] son of Ja-ah-. . ., king of Mari, and the country . . ., who built
the temple of . . ., who from . . . brought . . ., on the bank of the Eu[phrates], the bit šu-ri-b[i] . . . in Tirq[a], the beloved of the god . . .” (See Herzfeld RA 11 134 ff.). The script, which is that of the Ur Dynasty or earlier, and the knowledge we possess of Mari and the collapse of its political position (see below), make it highly probable that it belongs to a period not later than the middle of the third millennium B. C. Moreover, we learn from the inscription the fragmentary name of a Mari king, Zim- . . . and that of his father, also only partially preserved, namely Jah-. . ., who, it is reasonable to assume was also a ruler. This being true, we know the fragmentary names of three kings of Mari, the earliest being . . .-um-Shamash. Besides these Amorite kings, we know of Humbaba who was very probably a king in the Lebanon district in the time of Gilgamesh (see Chapter VII), and an early patesi of Ki-Mash (very probably Damascens), named Humimi. To these should be added the names of the four local Amorite kings mentioned in the fourteenth chapter of Genesis; but these ruled about the time the empire was dissolved, or even later. They were local city-rulers of Western Amurru.

In the latter part of the third millennium Elam entered the Western arena, and with the help of its vassals, conquered the Amorite world. The fourteenth chapter of Genesis informs us how in the Hammurabi (Amraphel) era, Elam had invaded the Amorite territory on the west side of the Jordan and the Dead Sea. It is not improbable that this is the time the hegemony of Mari was finally broken up, when the king of Elam became Adda Martu “Suzerain of Amurru” (UB 210, 6: 4). It is not unlikely that the fragmentary date for Hammurabi’s tenth year refers to this invasion, for in it the population of Malgu is mentioned, probably as having been carried away. A few years after Hammurabi had thrown off the yoke of Elam in his thirty-fifth year, he destroyed Mari and Malgu. The date reads: “The year in which Hammurabi after having destroyed the walls of Mari and Malgu, at the command of Ann and Enil,” etc. As this event followed closely upon his contest for supremacy with Elam, it would seem that probably Mari had attempted to regain its former status. Mari and Malgu doubtless required more than ordinary efforts on the part of Hammurabi, because of which their over-
throw was celebrated in the date formula. In his Code the law-
giver speaks of himself as the one who subdued the settlements
along the Euphrates, “the warrior of Dagan, his creator, who pro-
tected the people of Mari and Tutul.” The Code probably refers
to a time subsequent to the destruction of the city’s walls. Mari
thereafter ceased to be an important political power in Western
Asia.

Only two references in the Babylonian inscriptions to Mari sub-
sequent to the ascendancy of Babylon are known to the writer. In
a relief of the later period, Shamash-rēsh-ūṣur calls himself gov-
ernor of Suhi and Mari (Weissbach Mischl. 9 f.); and the city
is mentioned in a document as being in proximity to Suhi (CT 4,
2r: 20). In brief, the city Mari ceased to be a factor in the politi-
cal affairs of Western Asia after the time of Hammurabi.

Mari must be recognized as the city Mar of the early inscrip-
tions. The goddess whose name is written ideographically Nin-
Mariš, to whom Dungi erected or restored a temple in Girsu, is
the ba’alat of Mar.

From this centre, namely Mari or Mar, there went forth the
gods named Shar-Urra and Mesh-Lam-Ta-ē, two names of Ne-Uru-
Gal (=Nergal) the god of Cutha. The equation Marši = dNin-IB
identifies Urtu with the city.

The absolute identification of Mar with Mar-tw=Amurru=Uru
and the other forms of this name, see the previous chapter, gives
us every reason for identifying the city Mari as the centre we are
looking for, which was powerful enough to weld together the
Semitic peoples of this region into a great nation and to give it
the name Amurru; this it retained for millenniums, even subse-
quent to the time the hegemony was destroyed. Yet, it was in all
probability the home of the Chaldean antediluvian mythological
kings at the head of which stands El-Ur (Aloros), and who was fol-
lowed by five other kings whose names also contain the city-god’s
name, Alap-Ur (Alaparos), Amēl-Ur (Amillaros), Megal-Ur
(Megaloros), Ebed-Ur, the brother (Enedorachos), and perhaps
‘Ar-data (Ardates) (see Chapter IX). This also was the ancestral
home of Ishbi-Urra and Inmitti-Urra of the Nisin Dynasty; and
moreover it is highly probable that it was the home of Abraham.

Taking into account all that is known from the inscriptions, and
the conditions that we could propose in the identification of the imperial centre, no city in Amurr secretion the conditions as does Mari or Merra on the Euphrates. Further St. Stephen says Ur of the Chaldees was in Mesopotamia (Acts 7: 2, 4).

In this connection the question arises, when did Merra or Ur establish the hegemony which gave its name to the entire land; and when was it dissolved? Naturally it was established long before the time of Sargon, but whether as early as the time of Etana, Shar-banda or Gilgamesh, when Humbaba lived, or not, cannot be surmised. It is reasonable to infer perhaps that the empire was established prior to the time when . . . um-Shamash, king of Mari, ruled Babylonia. Sargon in turn humiliated Mari. He captured the city and invaded the region beyond, as far as Ibla (see above). Following the Kish and Erech Dynasties, Gutu ruled Babylonia; but Gutu in turn was overthrown by Erech. Another dark period followed, the length of which cannot be determined at present.4 The status of Mari in the West during the time of the Ur Dynasty, which followed, is not known, but the fact that these conquerors made no mention of the city is proof that its fortified position was too strong for them; yet they carried on their practice of looting and gathering tribute from the kingdoms beyond. During the Ur Dynasty, Mari certainly did not have a dominant position, for the Ur Dynasty kings assumed the title "king of the four regions," which included Amurr. But the time came when not only Ur’s control of Amurr was lost, but Mari actually overthrew the dynasty and ruled the land, for “Ishi-urra a man from Mari” was placed upon the Nisin throne. Although we have no way of determining the origin of Naplumin who took the throne of Larsa, his name and those of his dynasty are Amorite. Moreover it is to be noted that the Larsa and Nisin

4 The writer is one of those who have clung to a greater antiquity for Sargon than is now generally accepted. The tablets published by Scheil (Comptes Rendus 1911 6061) and Poebel (UMBS V) have restored some of the dynasties between Sargon and the Ur Dynasty, and he feels that more will become known as investigations proceed. It will probably not be possible to return to the former early date, but the present indications are that a much greater antiquity than now acceded, will have to be granted.
Dynasties were established at or near the same time (see Chapter IX). One of those dark periods in the history of Sumer and Akkad, which has left us few or no inscriptions, follows; although the length of the reigns would not imply disintegration in this instance, but perhaps rather foreign control, as mentioned above. Amorites a little later established a dynasty at Babylon; and as far as is known they ruled the whole land. As time passed the Amorite rulers became Babylonized. The Amorite dynasty at Larsa was overthrown by the Elamites, to whom also Babylon became subject. Elam invaded Amurru. Subsequently Hammurabi drove the Elamites out of the land, and a few years later conquered Mari, destroyed its walls, and also those of other strongholds along the Euphrates; when the imperial history of Mari or Amurru was closed.

It was said in Amurrnu (p. 103), concerning the name Uri for the country Akkad, or northern Babylonia, that it is not improbable that in some period, when the peoples of Amurrnu dominated Akkad, the name of the broad Amorite land Uri (=Amurrnu) was geographically extended to include it. The more recent investigations confirm this idea, especially since we know that the Amorites conquered Babylonia several times. If this is not correct, we can only assume that two countries, adjacent to each other, and inhabited by Semitic peoples who were closely related, had the same name, which in both instances was written with the ideogram BUR-BUR, and yet the names had nothing in common. Since the Western Semites at times invaded Babylonia, and sat on the thrones of the land, this scarcely seems as reasonable as the view that the name was given to Akkad in some early period when the peoples from Uri dominated it.

Recently the writer proposed the identification of the city whose name is written Ma-ri and Mar with Merra "a fortified place, a walled city," which was mentioned in his Parthian Stations by Isidore of Charax of the first century B. C. (see MI 4 f.) According to Isidore there was fifteen schoeni between the Aburas (Habur) and Merra, and twenty-two between Merra and Anatho.  

5 From the Aburas, Isidore informs us, it was four schoeni to Asich, six to Dura Nicanoris, five to Merra, a fortified place, a walled village, five to
X. UR THE CAPITAL OF AMURRU.

The latter city, as is understood (see below), was by 'Ana on an island in the Euphrates. Merra therefore should be less than half the distance from the Ḫabur to 'Ana.

The ruins of Irzi situated on a bluff or headland of a low range of rocky hills reaching the river on its north bank, although about midway between the Ḫabur and 'Ana, have been considered by Peters, 6 Schoff, 7 and others, to represent Merra. These picturesque ruins, which can be seen from a great distance, have been mentioned by all travellers who have noted the different sites on either side of the Euphrates. Černik, in his Studien Expedition 1872-3, gives the name El Bans to the city. Balbi says the ruins in 1579 occupied a city larger in extent than Cairo, and appeared to be the massive walls and lofty towers of a great city. This led Rennell 8 to identify Corsote mentioned by Xenophon (see below) with the site which he called Erzi or Irsah. Ainsworth commenting on Balbi's description thinks he mistook "the jagged and broken masses of gypsum for the fragments of an endless city" (Euphrates Expedition I 389). Also Miss Gertrude L. Bell, who examined the ruins, says she did not find bastioned walls, as she expected, but a number of isolated tower-tombs, round the edge of the bluff and over the whole extent of the high rocky plateau. She saw no traces of houses, nor means of obtaining water; she thinks it was the necropolis of a near-by town, and dates from the first or second century of the Christian era. 9 Whether beneath the tombs seen by Miss Bell belonging to recent centuries, ruins of an ancient walled city will be found if excavations are conducted, remains to be seen.

Olmstead seems to think that Isidore located Merra on the Euphrates at the town 'Isharah as exactly as one can locate a city

Giddan, seven to Belesi Biblada, six to an island, four to Anatho, two to Thilabas, twelve to Izan, and sixteen to Aipolis or Hit.

6 Nippur, or Explorations and Adventures on the Euphrates I 311 ff.
7 Parthian Stations by Isidore of Charax p. 24.
8 Illustrations of the Retreat of the Ten Thousand p. 103.
9 Amurath to Amurath 83 ff. Since Ainsworth ibid. p. 387 says the cliffs of Irzi were also called Al Wurdi by the Arabs, the name of the city further up the stream, it may be possible that Irzi was the necropolis of that city.
on the hour basis (*AJT* p. 284); but 'Isharab is too far up the stream. A little above Irzi on the Euphrates is the site of an ancient city which at present is called Werdi (also Wurdi). This site is less than half way between the Ḥabur and 'Ana, and seems to be nearer to the position given for Merra, by Isidore, than Irzi; it was fifteen hours from the Ḥabur and twenty-two to 'Ana. Werdi also is thought to be the Corsote of Xenophon, who referred to it as a large deserted city, which was entirely surrounded by the Masea, and where Cyrus passed three days on his march against Artaxerxes his brother (*Anabasis* I 5, 9). No other ancient writer is known to have referred to the city named Corsote. Doubtless in Xenophon's time the ruins of the ancient city were still in evidence. Ainsworth, however, says he saw no remnants of a city. The position of the city naturally makes it possible to understand this; the Masea mentioned by Xenophon is understood to be the loop canal which encloses the bend of the river on which Werdi stood. This canal is now called Werdiyeh.\(^{10}\) Since Mar and Mer frequently interchange with We-ir, it is reasonable to suggest that Werdi perhaps is from Werti, and is to be identified with Martu. If the site actually represents the ancient city Merra or Ur, this will appear most reasonable. Moreover, the remark previously made several times again seems appropriate here, the spade of the excavator can easily determine whether Werdi represents the city in question.

XI

OTHER MESOPOTAMIAN KINGDOMS

The kingdom of Iliana embraced a district of the middle Euphrates, including the country in the region of the mouth of the Habur above Merra. The discovery of a few inscriptions in this district fortunately throws considerable light upon the character of the civilization. One of the chief towns, perhaps at one time the capital of Iliana, was Tirqa; with which place four of the few inscriptions can be definitely identified. The site of the city is supposed to lie near Tell 'Isharah, where several of the tablets were found, a town situated between Ed-Dér (or Dér Ez-Zór) and Şâlihîya. This identification seems corroborated by the discovery also at that site of a votive inscription of Shamshi-Adad, in which he records the restoration of a temple in that city (see below).

The earliest reference to the city Tirqa is in the inscription of Zi-i[m . . .] king of Mari, referred to in the previous chapter, who restored the bît šu-ri-b[i] in that city. The inscription cannot be definitely dated, but the script and other considerations point to the middle of the third millennium B. C., when Mari was still probably the imperial city of Amurrâ.

The inscription of Shamshi-Adad referred to above reads: "Shamshi-Adad, king of the universe, the ruler of Enlil, the worshipper of Dagan, the patesi of Ashur, the builder of Ekisigga, the temple of his assistance, the temple of Dagan in Tirqa."1 In this inscription Shamshi-Adad calls himself "the priest-king of the god Ashur," which means he was the king of Assyria; "ruler of Enlil," which implies he was the suzerain over Babylon; and "the worshipper of Dagan," by which he regarded himself the patron of Tirqa’s deity. Doubtless he had conquered the city and district, and by his "pious deeds" attempted to placate the inhabitants.

There was an Assyrian king named Shamshi-Adad who lived

1 Condamin ZA 21, 247 ff.
in the time of Hammurabi; another bearing the same name ruled about 1850 B.C., and others about 1600 B.C. and in the ninth century. Shamshi-Adad III, who ruled about 1600 B.C., used the same title “king of the universe” (ṣar kisšati), and informs us that he was solicitous for the land between the Tigris and the Euphrates (KTA 2:1 ff.). It would seem reasonable to regard him as the one who rebuilt the temple in Tirqa referred to in the above mentioned inscription.

Besides this votive inscription, three contracts have been discovered. The first is a deed of gift which was granted by Isharlim or Isarlim (which name is identified by some with ‘Israel’), who was king of Išana, as shown by the impression of the royal seal on the tablet. The deed conveys a house in Al-eshshum, a part of the city Tirqa, which was the property of the gods, Shamash, Dagan, and Itur-Mer, and of the king. These names occur in the oath formula (LC 237). The date reads “In the year when Isharlim, the king, built the great gate of the palace in the city of Kash-dala.”

The second is a deed of gift of several plots of land in the towns Ja’mu-Dagan and Tirqa, to his servant Pagirum, by Anmi-bail, the son of Shumm’-rammu, king of the same district (I/S 7, 204). The oath formula includes the names of the same deities, Shamash, Dagan and Itur-Mer, and that of the king Ammi-bail, in whose reign the document is dated: i.e., “in the year when Ammi-bail, the king, ascended the throne in his father’s house.”

The third tablet is also a deed of land, in Tirqa, which is dated “in the year when Kashtiliashu established righteousness” (LC 238). The oath formula is similar to that of the other two deeds. Whether the Cassite king bearing this name is the one who lived in the eighteenth century, or the one in the thirteenth, or even another, it is impossible to say.

Another inscription from this part of the country is a marriage contract. Its exact provenance is unknown, but it certainly came from the same region. It is dated “in the year when Hammu-rabih, the king, opened the canal Habur-ibal-Bugash from the city Dûr-Isharlim to the city Dûr-Igitlim.” This would seem to show that a canal passed from Dûr-Isharlim on the Habur to Dûr-Igitlim. Since Dûr-Isharlim apparently was a royal palace, Dûr-
Igitlim may also have been the castle of Igitlim, another ruler of Ḥana. These two names which have been so frequently quoted, were incorrectly read Zakku-Isharlim and Zakku-Igitlim (Johns PSBA 1907, 177 ff.). The original, which is in Mr. J. Pierpont Morgan’s library, clearly reads Dūr-Isharlim and Dūr-Igitlim.

Johns identified the king with the Babylonian law-giver; but besides the date of the tablet not being a known date of the ruler, which fact he recognized, there are other reasons for believing the tablet was written in the Cassite period, unless it is assumed that the Cassites, prior to Hammurabi’s time, had already influenced Mesopotamia in an extensive manner. Besides the name of the canal, which is compounded with that of the Cassite god Bugash, one of the four personal names mentioned in the tablet, Kikkinu, shows Mitannian influence. The other three names of the contract, ʻBi-it-li-ʻDa-gan, Pa-gi-rum, and A-ba-ia, are West-Semitic. Further, the seal impression on the tablet, which has not as yet been published, is, as far as is known to the writer, peculiar to the Cassite period. These facts point either to the conclusion that the Cassites conquered this region prior to Hammurabi’s time, and that this great ruler recognized their deity in naming the canal he dug, which he did not do in any inscriptions known from Babylonia, and that he employed different date formulae outside of Babylonia; or else the tablet was written in the reign of another and later ruler.

The orthography ʻHammurabiḥ has no bearing on the question.

2 With the name Ki-ik-ki-nu we can compare Ki-ik-Tešup, Ki-ik-Tešup (‘IIM), Ki-ik-ia, Ki-ik-ku-li and Ki-ik-ki-ia-ču-ni (see Clay PN).

3 The text will be republished in Part IV of Babylonian Records in the Library of J. Pierpont Morgan.

4 It seems unfortunate that there should be so much confusion introduced into the spelling of the Babylonian lawgiver’s name, for besides Ḥammurabi there have been introduced Ḥammurabīḥ, Ḥammurapi, Ḥammurawi, and Ḥammu-ravīḥ. In changing the pronunciation, scholars have been trying to accommodate themselves to four facts: the Assyrian translation of the name kimla rapaṭum, offered by a late scribe; to Amraphel, in Genesis; the form Am-mu-ra-pi, in an Assyrian letter; and Ḥa-am-mu-ra-bi-ḥ in the Ḥana marriage contract. To these cases should be added the occurrence of the name written ʻAm-mu-ra-pi (YBC 4362), Am-mu-ra-bi
for the signs ʿih and ʾiʿ were used interchangeably both in the Hammurabi and in the Cassite period. There is a name in the Amarna letters El-ra-bi-ʾih (also written ʾi-li-ra-[bi-ʾih]) which doubtless represents the same element rabiʾ from the root meaning “to be great.”

Besides these four legal documents and the votive inscriptions of Zim . . ., and that of Shamshi-Adad, which throw most wel-

(YBC 6270), and Ha-am-mu-am-ra-pi (YBC 6496, 6508) on First Dynasty records, which have been discovered by Dr. Grice of the Yale Babylonian Seminary.

That this foreign name should be written occasionally with rapi instead of rabiʾ, and especially in Assyria, where the harder pronunciation of the labial is frequently found, is not surprising. There is some justification for the reading rapi from 𒆠𒆠 “to heal.” advanced by Prince, cf. Nabū-ra-puʾi (BE 10:51); but the element can scarcely be the Arabic rafīʾ, “high” (Thureau-Dangin OLZ 1908 93), nor with Hommel from the Arabic roots rabāḥa, rabagha, etc. (OLZ 1907 235 ʃ). Evidence that these roots were used in Arabic or Amorite names is necessary to make the suggestions convincing; and further, such a meaning as “Amm is wide” or “the family is broad” is without parallel for personal names. The assumption of Luckenbill, who makes the root 𒀀𒆠 “to airy, roomy, wide,” is still less convincing (JAOS 37, 252). Chiera’s Amorite list, as well as the Yale Gilgamesh tablet, show that the signs piʾ, biʾ, miʾ, and buʾ, muʾ, etc., represent similar Amorite sounds, but the statement that in Old Babylonian the word for “son” is not apla but maru, and that names read abil, “son,” must be changed to awil, “man” (UMBS XI 1, 37 ʃ), which Luckenbill accepts (JAOS 37, 252), is difficult to understand. Cf. ab-lim 31:54, Ab-la-tim 28:19, etc., of the Code; a-bil 17:1, a-bi-il 210:10, etc., VAB 5, and cf. A-bil(TUR)-Samaš, etc. (Rankе PN). Moreover, evidence of the use of this root 𒀀𒆠 in personal names is wanting; and besides the element would appear raḥ, instead of rawiʾ or rawiḥ.

While rawiʾ, rawiḥ, or rafīʾ are not found in Amorite names, rabiʾ from the root “to be great,” is very common. This element is even found in the Amorite names of Cappadocia. It seems comparatively easy to understand how the Assyrian scribe, mistaking the element Amm of an earlier age for the word meaning “family,” translated rabiʾ with ra-paštam. In short, this royal scribe of Ashurbanipal’s library was sufficiently educated to know at least the pronunciation of the name, which he wrote ra-biʾ; and biʾ in the Assyrian period cannot be read ʿei or ʾiʾ. The same is true of the
come light upon the civilization of the Ḥana district, especially in the early part of the second millennium B.C., there should be mentioned also another document of the early period which has been published by Pinches (CT 4, 1), concerning a certain Sin-iqīsham, the šābir of Sulḥi, who dwelt in Ḫaliṣ of Sulḥi. It would appear from this document that Sulḥi bordered on Mari. Shamash-rēsh-uṣur of a later period (see below), was šaknu of Sulḥi and Mari. Sulḥi has been placed above Mari near the mouth of the Ḥabur (HB p. 260, n), and it has been localized below, near ‘Ana, although it is recognized as a very indefinite place (Olmstead JAOS 38 p. 241). If Anat, Ḥanat, and Anath are different forms of the same city’s name (see below), it would seem that Sulḥi must have been below Mari.

These documents show that the Babylonian language, with the usual Sumerian formulae, was used for the legal documents; yet the terminology was peculiar to the district. Doubtless, back of the documents is a different code of laws. For example, in the case of any infraction of the rights bestowed by the king, there was to be a fine of ten manehs of silver, and in addition the guilty party was to have his head tarred with hot tar.

The nomenclature of these few contracts found in Ḥanat is especially rich in important characteristics of the Amorite civilization. They contain an unusually large number of Amorite names. Among them are many West Semitic verbal forms, like Ja-aš-ma'-Da-šu, Ja-ri-ib-Adad, etc. Of special importance is the frequent occurrence of the god Dagan in the names, about a dozen of which are compounded with that of the deity; and besides, several royal scribe who made a copy of the Code of Hammurabi for the library (CT 13:47). And surely the chronicler of early kings was sufficiently intelligent to know this name. The same is true of the royal scribe of Nabonidus, King of Babylon, when he referred to Hammurabi as living 700 years prior to Burna-Buriash. Even though the foreign name of this ruler was in a few instances written differently, these facts should be sufficient to prompt us to hold to the pronunciation these scribes deemed correct, namely, Ḥammurabi.

5 Cf. Ranke BE VI 1, Sign No. 195. Cf. also Ba-ah-lu-ti with Ba'-lu-ti, Ki-ša-ah-bu-at with Ki-ša'-bu-at, etc. (Clay PN); and ma-ah-du-ti 191:8 with ma'-du-ti 3:10, etc., Amarna letters.
individuals bear the title "priest of Dagan." On the seal of Išharlim, king of Ḥana, he calls himself "the beloved of Shamash and Dagan." In these few tablets several names contain that of ‘Ammu, as Jakun-Ammu, Bina-Ammi, Ammi-bail the king, Jašdi-Hammu, Zimri-Hammu, and perhaps Abilama his son. Two witnesses, Guri and Igitlim, and a man named Zimri-Ḫanata are designated as akīl of the god Amūru, which title was so commonly used by the Amorites in Babylonia in the time of the First Dynasty.

In this connection should be mentioned again the bringing back of the images of Marduk and Šarpanitum from Ḥani by the Cassite king Agum-kakrime, and their reinstallation in Esagila at Babylon. It has been suggested that they had been carried off during the Hittite invasion in the time of Sanšu-ditana (HB p. 210); but if Ḥani and the kingdom Ḥana are to be regarded as identical, it would seem that they had been removed during one of the early Amorite invasions, for the Hittites, if they had carried them away, would scarcely have left them in this region.

In 1885 Pinches published an inscription found by Bassam at Sippar, which also refers to Ḥana. The inscribed object is an oblong instrument partially of green stone, fixed into an ornamental bronze socket which is in the shape of a ram’s head, the eyes of which are inlaid with some white composition. On one of the broad surfaces is inscribed: "To Shamash, king of heaven and earth, Tukulti(-ti)-Me-ir, king of the country Ḥana, son of Ilu-shaba, king of Ḥana, for [the safety of] his land and his own protection he has presented it." The text is printed with Assyrian type, but when Pinches published the inscription in 1883 he considered that the script pointed to the time of the king then called Shalmaneser II. He mentions, however, that it contains a few archaic forms (TSBA 8, 351 ff.).

About fifty miles below the city Merra on the Euphrates is situated the present city ‘Ana. It is regarded as being indescribably picturesque, and perhaps the most delightful city on the Euphrates.

‘Ana has long been identified with the ancient ‘Anatho. Xenophon called the city Charmante. Isidore of Charax mentioned Anatho as being on "an island in the Euphrates of four stadia." The emperor Julian, of the fourth century, mentioned Anatha as being a city of importance, situated both on the islands of the river
and on the shore. Yakut, about 1225, refers to 'Anath as a strong fortress on an island.

The city 'Anatho is doubtless to be identified with the city Ḫanat mentioned in the tablet published by Pinches (CT 4, 1, see above), and Anat of Sulhi, referred to by Ashur-nāṣir-pal as a city on an island in the Euphrates (I.R 23: 15).

Whether there were twin cities, called 'Ana, perhaps on the bank of the river, and 'Anatu on the chief island, now called Lubbâd, to account for the different names handed down, remains to be seen. Yakut in regarding 'Anat a poetical form of the plural of 'Ana, is apparently mistaken.

Unquestionably these names have been correctly associated with the god and goddess Anu and Antu by Peters (Nippur I 144 ff.), and it is highly probable that this was the chief centre of their worship whence it was carried into the region lying east and west, even to Egypt. This being true, 'Anu and 'Antu were Amorite gods, as the writer has heretofore assumed (Amurru 142 f.; see further Chapter XVII). If Ḫanat and Anat are the same, it seems reasonable also that the name Ḫana, written in cuneiform Ḫa-na, the name of the district, should be identified with the name of the god written Ana, Anu, Anna, Ani, and especially since the Semitic ayin which the name contains, as is shown by the West Semitic forms, is very frequently reproduced by ḫ in cuneiform; cf. hammu, bahlu, yadah, etc., all reproducing the ayin, and especially in Amorite names.

The deity Ḫana is very probably the same as Ḫannu, Ḫani, and Ḫan, which occur in Amorite names of the Harran Census and other Assyrian and Babylonian texts. This deity presided over an advanced civilization in the West, as is determined by the discovery of the ancient Sumerian prototype of the Hammurabi Code, a single tablet of which has been preserved and is now in the Yale Babylonian Collection. The colophon of the tablet reads "the

6 On 'Ana and 'Anatho, see Černik Studien Expedition 1872-73; Ainsworth The Euphrates Expedition I 401 ff.; Peters Nippur or Explorations on the Euphrates I 144 ff.; and Schoff Parthian Stations of Isidore of Charax pp. 5 and 24; Scheil Annales de Tukulti Ninip II p. 42; Bell Amurath to Amurath p. 97; and Ohmstead JAOS 38 p. 241.
law of Nisaba and Ḥani’’ (*MI* p. 19 f.). The goddess Nisaba, “the patroness of writing” (*RA* 8, 110), who wielded the stylus and gave understanding to Gudea, together with Ḥani who was “the god of the scribes” and “lord of the seal,” are thus credited with being the givers of the laws. Perhaps Nisaba (or Nidaba), the consort of Ḥani, will prove to have been also a Western deity, but whose name, like Marduk and Nergal having been written with a cuneiform ideogram, in its transmission suffered a change in the pronunciation. It may prove to be the Sumerian name of Antu. From these considerations it appears as if the laws which have been credited to the Sumerians because written in their language very probably had their origin among the Amorites. And since the country was filled with these Western Semites during the Hammurabi period, and that dynasty was Amorite, it is not improbable that the Hammurabi Code drew extensively from Amorite sources. This may account for the fact that actions of Abraham are in accordance with the Code, e.g., his treatment of Hagar, his adoption of his slave and steward Eliezer, etc.

If the name of the city ḤAna and Ḥana are identical, the question arises was this the centre of the hegemony known as Ḥana which embraced the region of the Eniprates including the month of the Ḥabar. It is probable that the kingdom Ḥana was ruled by a city and deity Ḥana. But is ḤAna, with its twin city Anatho on an island, whose name is written Anat and Hanat, the city in question? If this should prove correct, it must be conceded that not a few difficulties remain to be explained. As above, Suḥi in the time of Ashur-nāṣir-pal embraced the region in which Anat, the supposed Anatho, was located; Shamash-rēsh-uṣur was governor of Suḥi and Mari; and as mentioned, in the tablet published by Pinches (CT 4: 1), which belongs to the early period, Suḥi borders on Mari. In other words it would seem as if ḤAna or Ḥanat belonged in these periods to Suḥi. Naturally the second millennium intervened, to which period the Ḥana contracts belong. Then also if the city ḤAna was the capital of the kingdom, the question arises did Isharlim, king of Ḥana, and perhaps also Ammi-bail, live in ḤAna or near Tirqa. The date of the marriage contract above referred to, as well as the land deeds, would seem to indicate that these kings were intimately identified with the
XI. OTHER MESOPOTAMIAN KINGDOMS.

region in which Tirqa was situated. These questions cannot be answered until we have additional light on the subject.

Shamash-rēš-nṣur, who calls himself governor of Suḫi and Mari, mentions the restoration of a canal of Suḫi and the building of a city named Gabbari-ibni. Tiglath-pileser I says in one day he raided the country from Suḫi to Carchemish (Annals V: 44 ff.). Several other important cities were located in this region. The date for the fourth year of Hammurabi referred to above, records the destruction of Malga as well as Mari. Tutul is another city in this district, which may prove to be Thilutha of Ammianus Marcellinus, now called Telbeis a little below ʿAna; where Julian informs us there was an impregnable fortress.

The kingdom of Ḥarran lay north of Ḥana, in the region which was called Aram or Aram Naharaim. There is an Arabic saying to the effect that the first two cities rebuilt after the deluge were Damascens and Ḥarran, implying that these cities were looked upon as very ancient. The name Ḥarran, which means "road," was doubtless so called because it was situated on the great trade route. In short, it would seem that Ḥarran was one of the most important cities in Mesopotamia in ancient times.

Unfortunately, references to the city in early literature are singularly wanting. The earliest reference to the district and city are found in the Biblical traditions concerning the home of Abram. Even the Amarna letters and the Egyptian inscriptions throw little light on the region, unquestionably due to the fact that Mitanni then had possession of the land. The Assyrian kings claimed to have controlled the region from the time of Adad-nirari I of the fourteenth century. From this time it was incorporated in the Assyrian kingdom.

Valuable information concerning the district, however, is obtained from an Assyrian census taken in the seventh century. Though this period is far removed from the one under discussion, nevertheless it is highly probable that much of the knowledge concerning the culture can be applied also to the early period.

In this census of the district about Ḥarran, such details of each

7 Identified by Scheil Tukulti Ninip II p. 49.
8 Johns ADB.
form of arable land as vineyards, orchards, gardens, etc., are recorded. The names of the *pater familias* and his sons are given; the women are merely enumerated, as are also the live stock. The kingdom was divided up into units, called *qānī*. Certain cities, as Ḥarran, Dūr-Nabû, etc., were the centres of these *qānī*. The Ḥarran *qānī*, for example, included the towns 'Ātnu, Badāni, Ḫanatā, Ṣaidi and Ḥān-sūrī, and the villages Arrizu and Kaparu.

The kingdom was divided up into units, called *qānī*. Certain cities, as Ḥarran, Dūr-Nabû, etc., were the centres of these *qānī*. The Ḥarran *qānī*, for example, included the towns 'Ātnu, Badāni, Ḫanatā, Ṣaidi and Ḥān-sūrī, and the villages Arrizu and Kaparu.

The large list of cities, towns, and villages that are named in the different *qānī* of the kingdom will prove of the greatest importance when this region is explored, and excavations are conducted. Attempts at identifying some have been made, as for example Sarugi, which name is compared with Serug an ancestor of Abram, is thought to be represented by the present town Serudj. Balihi is thought to be on the river bearing that name, south of Ḥarran; Til-Naḥiri is associated with Nahor, another ancestor of Abram.

The personal names found in these tablets are of great importance in throwing light upon the cults of the district, for they inform us what gods were worshipped. The list of gods embraces Adad, Ata, Atar, Aja, Alla, Ashirta, Ḫānī, Nabû, Nashûn, Shamshi, Šēr, Si’ or Sin, Tēr, etc. The elements with which these names are constituted are in many instances Aramaic. Besides the use of the generic term for god, namely *īlu*, the deities occurring most frequently are Si’ and Nashûn or Nashuḥ. Ḥarran was known to be the great centre of the worship of the moon-god Sin; and we here learn that the city was perhaps also the original habitat of Nashûn, who became Nushu in Babylonia (see Chapter XVII). Doubtless, as investigations continue other important states in this Mesopotamian region will become known.

THE MEDITERRANEAN KINGDOMS

The various kingdoms or lands in the western part of Amurru bore different names in different periods; also some of the names used among one people differed from those used at the same time by another. In the early Egyptian inscriptions, the Lebanon district was called Retenu, while in the early Babylonian inscriptions it was called Tidannu or Tidmu. In the time of Gudea, Tidnu, together with Basalla, were designations of a mountainous district of this country. In the early Egyptian inscriptions, Phoenicia was called Zahi. In the Amarna letters this region including the Lebanon district was called Amurru, as well as in the late Egyptian inscriptions; which name, as noted already, was used in Babylonia for the entire land west of that country.

The name Tidnu was written with the cuneiform ideogram GİR- GIR. This ideogram also represented the name Amurrâ. GİR-ra also stood for Amurru. In the Amarna letters one of the districts probably of Palestine is called Gari (mә'Ga-ri). Winckler, Hommel and Steuernagel located it in the Negeb. Weber seemed to think that it was a mistake for mә'Ga-(az-) ri (Amarna-Tafeln p. 1319). In view of the fact that Gazri is eight times referred to in the letters as a city and not as a country, this does not seem probable. Niebuhr, followed by Knudtzon, have suggested the identification of the name with the present El-Ghor, the Jordan plain. In Ta'annek No 2, there is a city Gur-ra. It is to be noted that Gir figures prominently in Babylonian place or geographical names, which in the light of other facts gives rise to the question, whether there is any connection; and especially as the worship

---

1 Cf. the equation ṣātin—GİR-ra = A-mur—din-ni (II R, 45:59c; V R, 8:85).
3 A name of Akkad, as noted before, is Uri, which is the name also of Amurru (see Chapter VII). It is, to say the least, an interesting coinci-
of the West Semitic god Gir was carried to Babylonia (see Chapter XVII).

A kingdom which properly belonged to the western region of Amurru is that which embraced the city of Damascus. The name of the district is called Ubi in the Amarna letters and the name of its chief principality is $^{a}Di$-maš-qa, $^{a}Du$-ma-aš-qa and $^{a}Ti$-ma-aš-gi. The region at this time was subject to Egypt. In the Old Testament, the expedition of Abram to secure Lot, pursued the eastern allies unto Hobah, which is on the left hand of Damascus. Hobah has been identified with Ubi. In the time of David, a city Zobah between Hamath and Damascus is mentioned as the principality of Rezin, who later established himself in Damascus. This Aramaean kingdom lasted for over two centuries. The history of this kingdom, which lost its political importance when Rezin in concert with Pekah, king of Israel, rebelled against Assyria, is well known.

The fact that Damascus is not more frequently mentioned in the inscriptions of the early period is not due to the fact that it did not possess much importance. The "eye of the world," as Julian called it, could hardly have been other than a city of the greatest importance in the earliest period of the land's history. The plain of Damascus, regarded as the fairest of the four earthly paradises by the Arab, a rich and beautiful oasis, irrigated by the cold and clear mountain waters of the Barada, through which also flows the Pharphar, and adorned with a wealth of parks and gardens, is a veritable "pearl of the East." But it was not only a great city in the latter half of the second millennium B. C. Such a natural
dence that the name for the southern part of Babylonia has as its chief component also an element similar to another Amorite geographical name. For years it has been held that Shin'ar (or Sumer) is derived from Kin-gi($n$). "land of the reed," by assuming the palatalisation of the $k$, which becomes $s$ before $i$, and $n$ becomes $r$; i. e., Kin-gi = Kin-gir = Singir = 𒄩𒉁. This explanation has been adopted by certain scholars. It seems to the writer, however, since we have no justification for the reading Kin-gi($n$), that the second element in the name is gir, as shown by Ki-in-gi($r$)-ra ($SBH$ 130, obr. 24:25, 26:27), Ki-en-gi($r$)-ra($DU$) ($Gudea$ cyl. A 11:16; 21:25; B, 22:22). The apocopeation of $r$ in Sumerian is well known.
site in the very heart of the ancient Semitic world was inevitably settled in the hoary past. Such a site on the border of the desert, a veritable harbor, would never have ceased to be inhabited, and would by reason of its situation be a city of craftsmen and a mart for a large area of the Semitic world. Such considerations prompted the writer to look for the city mentioned among the earliest records of Babylonia, which resulted in the identification of Mash or Ki-Mash in the inscriptions of Gudea and in date formulae of the Ur Dynasty, as the ancient name of the city; and also in asserting that it is highly probable that Mesheq in the Old Testament (Gen. 15: 2), is the same, namely Mash-qi. In other words, Mesheq in the passage is explained by the gloss "that is Damascus." There is a seal-cylinder in the Hermitage at Petrograd of an ancient king, "Hu-un-ni-ni patesi of Ki-Mash, governor of Madqa . . .," which apparently belonged to an early period.

If the identification of the mountain Mashu of the Gilgamesh epic with Hermon, and the city Ki-Mash with Mesheq (Damascus) is correct (see Amurru 126), then it seems highly probable that the early name of the country was Mash, which is to be identified with Mash, "a son" of Aram (Gen. 10: 23). This being true, the name for the Syrian desert found in the Assyrian inscriptions, although read m š Bar by some, and associated with the Hebrew word midbar, is preferably to be read with others, mš. Mash. The Joktanites (Arabian tribes) dwelt in the land "from Mesha as thou goest towards Sephar, the mountain of the East" (Gen. 10: 30). Sephar has not been located, but it seems that the direction in the description of the land, occupied by these descendents of Eber, was from north to the southeast; and that Mesha is probably the city referred to. On the deity Mash and Mashtu see Chapter XVII.

4 The verse would then read: "And Abram said, O Lord God, what wilt thou give me, seeing I go childless and my family is a son of Mesheq—that is Damascus—Eliezer." See Amurru 129 ff. and Misc. Inscr. p. 2.

5 Cf. Sayce ZA VI, 161; and VB I 176.

6 The parallel passage 1 Chron. 1: 17, reads Meshek and the Septuagint in both passages Mesōx.
There is a city Me-īš-tu mentioned in the Amarna Letters (256: 25). This may prove to have been a city dedicated to the goddess.\(^7\)

In the far north of the Mediterranean region there is a Somitic centre which played an important rôle in the earliest period of history, as it does even at the present time, namely Aleppo. It is long since that Ḥallāpu, probably also written Ḥalma, has been identified by scholars with Aleppo.\(^8\) Its great distance, however, from BABYLONIA, as well as other reasons, is responsible for hesitation on the part of some in accepting this identification.\(^9\) The natural features of the city make it another location that would easily be sought by people; and this, it would seem, adds to the reasonableness of the identification.

Two fragments of a historical epic which deals with events of the time of Shar-banda and Tammuz, two kings who ruled in the earliest era known, refer to wars against Elam below, Ḥalma above, and Tidnum in the West (see Chapter VIII). Ḥalma is identified as another form of the name Ḥalman.

A text which has just been published by Barton is of the greatest importance in this connection (MBI 1). It is the earliest religious text known. It was probably written, as he maintains, about the time of Sargon the founder of the dynasty of Akkad, who ruled, the present writer inclines to think, much earlier than the late date now generally assigned to him. Barton reads the passage in the text: Tišpaka-ra ki za-ba-unu-šu and translates: "To Ishtar from the land of Ḥaleb." This text identifies the goddess Ashirta, as the present writer prefers to write the name, with the city Ḥalabu. We then recall the passage in the prologue of the Code of Hammurabi (III 50 f.) which reads: "Who put into execution the laws of Aleppo, who makes the heart of Ashirta rejoice, the illustrious prince, the lifting up of whose hands Adad recog-

---

\(^7\) If the writer's reading En-Mashtu for the Aramaic transcription of dNin-IB, namely Ṣem'ūN, is correct (see above and Amarna p. 200), the town dMe-īš-tu may be the dNin-IB of the Amarna Letters.

\(^8\) See Delitzsch Paradies p. 275; KAT\(^a\) 47 etc.

\(^9\) The fact that Ḥalabu and Bit Karkara are mentioned in the prologue to the Hammurabi Code between Girsu and Adab is suggestive that they were Babylonian cities; but this is by no means conclusive. That this city was a part of Babylon, as has been inferred, seems impossible.
XII. THE MEDITERRANEAN KINGDOMS.

Hulates; who appeases the heart of Adad the warrior in Karkar, who reestablishes the appointments of the temple E-ud-gal-gal." These two passages point to the fact that this is the most important centre of Ashirta-Ishtar worship known; and also, together with the first mentioned passage, indicate that the city was one of great prominence in the early period of Babylonian history.

Ashirta-Ishtar has been regarded by some scholars as a universal Semitic goddess, who became a male deity in some lands. Her worship, however, originally had a centre somewhere in the Semitic world. The texts from the Mesopotamian region would not lead us to suppose that her habitat had been there. The view that Ashirta-Ishtar had her origin in Arabia and is a development from the male god Athtar has little in it; nor was she borrowed from Babylonia. In the light of the fact that the cult of Ashirta prevailed so extensively in Western Amurru, and was carried comparatively early to Egypt, it would seem that her habitat was somewhere in the Mediterranean district. Surely the two texts referred to, the one belonging to the early Semitic period, and the other to the time of Hammurabi, lead us to believe not only that Ḫalabu, or Aleppo, is the most important centre of her worship known, but also that it was probably her original habitat. This fact may throw light upon the Cappadocian tablets, which furnish us with many names compounded with Ashir and Ashirta. Probably the home of each was in this northwestern region of the Semitic world.

Ḫalabu was also a centre of Adad worship, of which we have several indications in the inscriptions. The Code of Hammurabi in the passage above referred to, as well as the syllabaries, point to this fact. In CT 25 16: 22 dḪa-la-bu=dLM. Naturally it is possible that another of the many names of the storm-god may be implied, as Ashir, Uru, etc., but for the present Adad is understood. Prefixing and pronouncing the word "god" besides writing the determinative for deity are West Semitic customs, to which the writer has previously referred. In short, it is highly probable that when excavations are conducted in this region, light will be forthcoming that will show not only that this is a very

\[\text{10 Cf. also eqli } d\text{Sin } d\text{Ḫa-la-ba} ki \ VS 7, 95: 4.\]
ancient seat of Semitic culture but the home of the Ashirta cult (see also Chapter XVII).

From the Egyptian inscriptions it is ascertained that at least several of the coastal cities, notably Byblos, were in existence in the third millennium B.C., and, as stated, there is reason for believing the city had a much greater antiquity (see Chapter XIV). Simyra, another city on the coast mentioned in the Amarna texts, the modern Sunira, is also known in the texts of the third millennium B.C., having been identified with Simurru mentioned in the date formula of the 55th year of Dungi, king of Ur, about 2400 B.C. Some hold that Simurru was situated in the mountainous district to the east of the Tigris, because the subjection of the four cities Urbilum, Simurru, Lulubu, and Ganlar formed the object of a single campaign (SA, p. 287). This does not seem conclusive, for it is quite possible that Lulubu was chastised at the beginning or at the ending of the year’s campaign. Urbilum may have been a city in the vicinity of Simurru. On his following campaign, Dungi destroyed Humarti and Ki-Mashki. Humarti has long since been identified by some with the Biblical Gomorrah, being a good transcript of that name in cuneiform; and Ki-Mashki, as noted above, is very probably Damascus. Certainly Dungi in gaining the title “king of the four quarters,” had at least conquered part of Amurrn. Here properly the Amorite kingdom of the Lebanon region can be referred to, which belonged to the latter half of the second millennium B.C.

The letters written in the Babylonian language and script to Amenhotep III and Amenhotep IV by kings and subject princes, including copies of letters sent from Egypt, in the fifteenth century B.C., enable us to lift the curtain and get an intimate acquaintance with the political situation of Western Amurnu at that time. The discovery of the Hittite archives at Boghaz-köi, an ancient capital of the Hittites, written in the same language and script, supplements our knowledge of this period from a different source in a most remarkable manner; and also throws light on more than a century of years following the Amarna times. These documents include treaties made by the Hittites with kingdoms and states in Amurrn (see MDOG 35). For years the Amarna tablets have been discussed and the light offered by the Boghaz-köi tablets has
also been incorporated in the histories of the ancient Near East. When more knowledge of the early peoples of Amurru is forthcoming through excavations and research, these inscriptions will figure prominently in a comprehensive reconstruction of the land’s history.

In the reign of Thutmose I (1547?-1501), the Mitanni nation, probably an Aryan people, is found occupying Aram, having taken possession of the old Semitic centre in some previous period. Mitanni apparently was a strong nation, and had great influence upon Amurru and Babylonia. Though the Cassites were ruling at Babylon, we find the nomenclature of the land contains a great many Mitannian names. In the Amarna letters, many of the city princes of Amurru also bear them. How is this to be accounted for? Did Mitanni at some previous time control Amurru along the Mediterranean? Three or four decades after the Hyksos were driven out of Egypt, Thutmose I is found contesting the supremacy of Mitanni. Probably we shall later on find that Mitanni played a rôle in the movement that brought the Hyksos into Egypt. Thutmose IV, a century later, desiring to establish friendly relations with Mitanni, secured the daughter of Artatama, the king, for his son in marriage. She is thought to be the mother of his son, Amenhotep III. The two kings of Mitanni who followed, Shutarna and Dushratta, also sought alliance with Egypt.

In the Amarna period, however, Mitanni’s power was waning and seemed to give way to the Hittites. Internal troubles probably were responsible for this, for we find Itakama, prince of the city Kinza, who belonged to the ruling house of Mitanni, in league with the Hittites. Shubbiluliuma, their king, having previously suffered at the hands of Mitanni, saw his opportunity to push further south and make inroads upon the Egyptian districts and Mitanni. In league also with Abdi-Ashirta and Aziru, Amorite princes in the Lebanon district who were subject to Egypt, he succeeded in stirring up a revolt. These princes worked in the interests of the Hittites and yet maintained their relations with Egypt by a duplicity that is almost incredible. The Phoenician prince Rib-Addi of Byblos insistently made efforts to open the eyes of the Pharaoh, but in this he failed. When asked why he had taken Simyra, Abdi-Ashirta pleaded that he had done so because
he was asked to deliver the city from the Shehlal. At last the insistent declarations of Rib-Addi and other loyal princes had effect, and the prince's treachery became clear; whereupon an army under the Egyptian Amanappa was sent, and Simyra was retaken, and with the land Naharin, was restored to Egyptian authority.

Shubbiluliuma, not wishing to force matters at this time, abandoned Itakama of Kinza and withdrew. When the Egyptians had retired he fell upon districts of Mitanni, and without meeting Dushratta, marched in force into Naharin. Some princes resisted; cities were captured; and the people of Qatna and the land of Nuhashshi were carried off to the Hittite region. Itakama, who had in the meantime reestablished his relations with the Pharaoh, together with his father Shutarna, attacked the Hittites; but they were defeated, and carried away.

On the accession of Amenhotep IV to the throne, the kings of Mitanni and Babylonia sent assurances of their sympathy on his father's death; and Shubbiluliuma also wrote him, recognizing his sovereignty in Asia. At this time he refrained from doing any overt acts which might arouse him. The Pharaoh, however, understanding the situation, had no desire to continue relations with him. Later the Hittite king wrote asking why he had not continued the correspondence which had been kept up by his father. A Hittite embassy even appeared at the new capital, which had been created by Amenhotep; but he abandoned relations with the Hittites, for they had encroached upon his land.

Abdi-Ashirta having been killed, his place was taken by Aziru, his son, who had already assisted the Hittites in taking Qatna, and in inspiring the princes of Ubi, the district about Damascus, to revolt. With the assistance of the men of Arvad he attacked Simyra, which with Byblos alone had held out, for Irkata, Ullaza, Sidon, Beirut, and other cities had been defeated, and had gone over to him, while many other cities had been captured. During the time this had transpired, the faithful vassal, Rib-Addi of Byblos, continued to write beseeching many times to his king, exposing the treachery of Aziru and begging for help; but his efforts were futile; in the end he was killed, and his city taken.
Phoenicia, and the Lebanon region north of it, including the Orontes valley, about as far as Antioch, acknowledged the leadership of the Amorite Aziru.

The disaffection of the northern Amorites had its effect upon the Canaanite princes. Several, as Milkili, Labaya, Zimrida and others, followed the same course of treachery that Abdi-Ashirta and Aziru had indulged in. Some of the southern princes, Biridiya of Megiddo, Abdi-Hiba of Jerusalem and others remained faithful to Egypt and insistently appealed, as did Rib-Addi, for help, to stem the tide of the Hābīri and Sutū; but finally the land succumbed.

Aziru was summoned to appear before the Pharaoh after he had captured the cities and killed Rib-Addi, Abi-milki, and other princes. After some delay he appeared at the Egyptian court, and succeeded, through influence, in convincing Amenhotep that he was loyal; and having acknowledged Egyptian suzerainty, was returned to his land and reinstated, by the grace of Egypt, as a ruler of a kingdom of considerable extent. But his allegiance to Egypt, if he was actually sincere, was of short duration. Shubbiluliuma had sent his mercenaries, the Hābīri, to assist him in capturing the cities, and he had regarded him in consequence as his vassal. He therefore attacked and defeated Aziru, who cast himself at his feet, and swore allegiance. He was compelled to enter into a treaty; and an annual tribute of 300 shekels in gold was placed upon him. Aziru in the treaty is named as "the king of the Amorites." Although the Hābīri had assisted the northern as well as the southern princes to throw off the yoke of Egypt, it is not clear that Aziru's kingdom included Canaan. From the treaty drawn up in the time of Ramses II, it would seem that the Pharaoh had concluded an alliance with Shubbiluliuma, leaving him in possession of Amurru. With Aziru's grandson, Abbi-Teshshub, the terms of the Amorite vassalage were renewed in a treaty which Mursil, the son of Shubbiluliuma, made with him.

The Hittites continued to maintain their authority in the district for four or five decades, until the stupor that enveloped Egypt, which had been brought on by Amenhotep IV, had disappeared. When Seti I came to the throne, he pushed through Palestine into
Phoenicia, where the restoration of Egyptian supremacy was probably welcomed. He crossed the Jordan and set up his boundary stele in the Hauran. On a later campaign he met Hittite forces farther north, but it seems he only succeeded in re-establishing Egypt’s boundary south of the Lebanons. During the time when Ramses II was active in Aniurru, the Amorites under Put-Ahi threw off their allegiance to the Hittites; but this king was later reinstated on the same terms of vassalage, and Gashuliawi, a Hittite princess, was given him in marriage. The Hittite king stipulated in the treaty that the sovereignty of the land should pass to the son and descendants of his daughter (see MDOG 35, 43 ff.).

In the treaty later drawn up by Ramses II and Hattusil II, the boundary between the two lands is not mentioned. Probably it was not advanced beyond the point established by his father; although this is also indefinite. In the rocks near Beirut, in his early years he had carved a stele; at this time he carved two more, which may mark the extreme point of his supremacy. This being true, the Lebanon country north of Phoenicia, ruled by Put-Ahi, continued to be Hittite. Since the Solomonic kingdom did not embrace Phoenicia and the coastal cities further north, it is not unlikely that this kingdom continued to maintain its identity for several centuries; not only in quasi-independence, but probably, at least for part of the time, free from the suzerainty of other nations. On the Amorite kings who ruled on the east and west side of the Jordan see Chapter XV.
XIII

AMORITES IN CAPPADOCIA

As early as 1881 Pinches called attention to two tablets, one in the British Museum, and the other in the Louvre, which he considered were written in an unfamiliar language, and which because the tablets had come from the neighborhood of Caesarea, he called Cappadocian (PSBA Nov. 1881 11 ff.). A little later Professor Wm. M. Ramsay, at the suggestion of Professor Sayce, searched in the bazaars of Caesarea for additional specimens of these tablets, five of which he was able to secure. Subsequently M. Chantre, the French explorer, excavated Kara Eyuk "the black mound", so called because it is a mass of charred and burnt remains, about fifteen miles to the north-east of Caesarea, where the inscriptions were said to have been found. Besides tablets, considerable pottery and other antiquities were discovered at the site. (Mission en Cappadoce 71 ff.)

In 1889 M. Golénischeff, the Russian Egyptologist, published a group of twenty-four tablets coming from the same quarter, which he secured in the bazaars at Caesarea, Constantinople, and Cairo. He determined that they were written in an Assyrian dialect; and was able to read most of the names. Later Delitzsch published an important philological study of these tablets; which was followed by a discussion of them on the part of Jensen. Subsequently Sayce and Peiser published transliterations and translations of a selection of the texts. Other tablets have since been published by Pinches, Sayce, Scheil, and Thureau-Dangin.1 It was early pointed out by Sayce and others that the people of this district observed a week of five days (ḫamuštu[n]), and reckoned time by a succession of officers called eponyms (limmu), a custom which we know the Assyrians observed in the first millennium B.C. These facts considered in connection with the use in names of the

1 For a bibliography of the Cappadocian literature, see Johns Schweich Lectures 1912 88 ff.
god Ashir or Ashur were responsible for the assertion that the people represented a colony from Assyria.

More recently Sayce has proposed that the tablets show that the silver, copper and lead mines of the Taurus were worked for Babylonian firms; that roads and walled cities had been built in that region in order that troops could maintain order for the Babylonian merchants and their agents; and that the soldiers were mainly drafted from Assyria, which was then a province of Babylon.2 The view that the names represent Assyrians, and that the tablets are dated according to Assyrian eponyms is shared also by Meyer.3 It is Jastrow’s idea that the discovery of these tablets shows that the Babylonians had established an outpost here against the Hittites; that they are proof of active business transactions between the Euphrates valley and Asia Minor; and that they are of the greatest value in illustration of trade routes that must have been established through the heart of Asia Minor at this early period.4 It is not impossible that these observations will ultimately prove to be fact; but nevertheless they must for the present be considered as wholly hypothetical.

The only connection with Babylonia found on the tablets is in the impression of a seal found upon one of them (RA VIII 142); the inscription of which reads:

\[
\begin{align*}
\text{Ibi-Sin} & \quad \text{Ur-d-Shar-banda} \\
\text{The mighty king} & \quad \text{Scribe} \\
\text{King of Ur} & \quad \text{Son of Ur-Nigin-Gar} \\
\text{King of the four quarters} & \quad \text{thy servant}
\end{align*}
\]

The design of the seal portrays a seated deity, before whom stands a demigod leading the worshipper. This seal which has its inscription written in Sumerian is in every way an exact counterpart of many seals found in Babylonia belonging to the Ur Dynasty; and is of a type altogether different from other seal impressions on the tablet. It also should be added that the individual bearing the name that is on the seal is not found in the text.

With the exception of this seal the art of the others on the tablet

3 Reich und Kultur der Chetiter p. 51.
4 The War and the Bagdad Railway p. 40.
that have been published seem to be of a different type, and show characteristics which are peculiar to the seals that Ward has designated as Syro-Hittite. The inscriptions of eight seal impressions of different tablets published by Thureau-Dangin, with the one mentioned above, are composed of two lines, written phonetically, an example of which is:

Ib-ni-Adad  

The art, as shown in the reproductions of the seals, which are not so clear as one could desire, seems to show that it also is different from what is recognized as Babylonian.

What appears to be the only actual connection with Assyria that can be shown is to be found in a seal impression on another tablet from Kara Eyuk, published by Sayce, which bears the following inscriptions: Šarru-kēnu(?), pa-te-si 4A-šir már I-[ku-num] pa-te-si 4A-[šir] "Sar[gon], priest-king or Ashir, son of I[kunum], priest-king of Ashir" (Babyloniaca IV 66 ff.). A transcription of the inscription has been published, but not a photographic reproduction of the seal impression. Whether any images accompany the inscription is not stated.

Sayce restored the name I-[ku-num], and ingeniously suggested that Šarru-kēnu is an abbreviation of the name Šar-ken-kata-Asir, whose name follows Ikunum as an ancestor of Ashir-rim-nisheshu (KTA 63: 6) on the supposition that in this inscription they are father and son; although close relationship cannot exist between the other three kings or patesis who restored the wall of Ashur during a period of about seven hundred years.

In the advanced notice of the Ashur excavations reference is made to a Sharru-ki-in son of Ikunum in a newly discovered inscription (MDOG 38 p. 33, also 49 p. 50). It would seem, therefore, that Sayce's suggestion is probably correct, although it is possible that there was a later ruler named Shar-ken-kata-Ashir. Moreover, the inscription of the seal found on the Cappadocian tablet refers to Sargon, son of I[kunum], who were both patesis of Ashur.

This seal, besides the employment of the five-day week (hamuštium), the dating by archons for reckoning time (limmu), and the deity Ashir found in personal names, represent the points of con-
tact with Assyria that have been pointed out; and the seal impression discussed above is the only point of contact with Babylonia, except that the Babylonian syllabary is used. The working of mines by Babylonian firms, the building of roads and fortresses as outposts against the Hittites, the drafting of soldiers from Assyria, the business relations between the Euphrates Valley and Asia Minor, although possible, are purely conjectural ideas. In the many Cappadocian tablets published the writer sees no basis for any of these statements. On the contrary, they are business and legal documents such as are commonly known as contracts and decisions, as well as letters of the character usually found in Babylonian temple archives. The transactions referred to are local business affairs; and indicate a state of society quite independent of far-off Babylonia or Assyria.

The tablet with the Babylonian seal gives the names of three witnesses, Zilulu, Ašur-dan, and Ikumum, and mentions their seals. On the tablet, however, are five seal impressions, three of which bear names Ikumum, Amur-Asīr and the Ur-Šar-banda the royal scribe on the seal in question. The two impressions without names could be those of Zilulu and Ašur-dan, and that of the other, the scribe who wrote the tablet. But in what capacity was the seal of Amur-Asīr used, as his name is not in the text?

The seal of Ur-Šar-banda may have belonged to a royal scribe who drew up the document; in which case the tablet was written in the time of Ibi-Sin, King of Ur. It of course may have been used at a later time by one of the contracting parties of the document or a witness who had come into possession of it. The occurrence of the seal bearing the name Amur-Asīr must be explained in this way; for as stated, no individual of that name is mentioned in the document. However, since we know that the control of the Ur kings very probably reached into this region, and because the script of the tablet can be said to belong to this general period, it is possible that the scribe was a representative of the crown. This being true, how is the existence of the names in the tablets which are compounded with that of the deity Ashir or Ashur, and the observance of the šamšūtu and limmu to be explained, if what scholars assert is true, namely that these are importations from Assyria? If that is correct, it follows that they are indications
of a greater antiquity for the Assyrian civilization than is at present recognized. But it scarcely seems reasonable that Assyrian soldiers in the control and service of Babylonia would have had such influence upon the culture of the district as the introduction of such institutions as the hamuštam, and that documents would be dated according to Assyrian reckoning. Rather does it seem, if these are actually importations, that Assyria dominated the district in some earlier period, of which also we do not have at present the slightest indication.

The tablet with the Assyrian seal discovered in Cappadocia, and written in the Cappadocian dialect, raises questions even more difficult to answer. Is it actually a seal of the patesi; and if so, was he present in person; or was it used by some official to give authority to his action? If there was one ruler named Ilu-shuma in the early period who was a contemporary of Sumu-abu, the founder of the Babylon dynasty, Sargon would have ruled about the time of the grandfather of Hammurabi. If, as Meyer proposes, there were two early rulers named Ilu-shuma (Geschichte §463), then Sargon could have ruled perhaps after the time of Hammurabi. Moreover, the question is, did the jurisdiction of Assyria extend to this far away district of Asia Minor also in this period? If the kings of the Ur Dynasty controlled this region at an earlier time, did Assyria, when Ur lost its supremacy, come into possession of it? If so, Assyria must have played a rôle in the overthrow of the Ur Dynasty, of which also there is at present not the slightest indication. Moreover, in the time of Hammurabi, as above, we know Babylon was the suzerain over Assyria.

At Yuzgat a large tablet was found written in the same script, but in another dialect, probably the same as the tablets from Arzawa in the Amarna collection. This tablet is in possession of the University of Liverpool. Another, purchased at Aleppo, now in the possession of Mr. Berens, which was published by Sayce (PSBA 1907 91 ff.), probably came from a Hittite source in northern Syria. In the spring of 1914 about two thousand tablets were discovered somewhere in Cappadocia, a large number of which are now in the British Museum, the Ashmolean Museum and the Bodleian Library at Oxford. Unfortunately these have not yet been published or deciphered.
The discovery of the Amarna tablets written by princes throughout Western Asia has shown how extended was the use of the Babylonian syllabary and also the language in the middle of the second millennium. Some of the letters show that the script was used also for other languages. The same is demonstrated by the discovery of the Hittite archives at Boghaz-köi, not far from Kara Eyuk on the other side of the Halys. In other words, we are familiar with an extensive use of the Babylonian language and script in the second millennium B. C. in this part of the ancient civilized world.

The Kara Eyuk tablets, we are led to believe, belong to the third millennium, which supposition is based largely upon the script being regarded as early Babylonian. The question therefore arises, how much earlier was what we call the Babylonian script in use in this part of the ancient world? It is known that Babylonian kings a millennium earlier than the Ur dynasty exploited this region. Were their language and script then introduced? Searcely the surface has been scratched in this vast region. Most of what we know at present of the peoples who lived there has been gained through what is called surface research. Kara Eyuk, Boghaz-köi, and a few other sites have been examined, but what revelations will excavations at other sites in Lycia, Phrygia, Cilicia or Pamphylia bring forth. A civilization comparable in antiquity and development with that of Egypt and Babylonia doubtless existed in Asia Minor. The discovery of the Minoan civilization in Crete dating about 2800 B. C. offers a foretaste of what is to be expected. The ruin hills of Asia Minor when excavated will yield materials not only for the solution of innumerable problems, but also for knowledge of undreamed of peoples and civilizations prior to the dawn of the Greek period. Not many years ago nothing was known of the Hittites save what is contained in the Old Testament. To-day largely through contemporaneous records from other lands, and also through some of their own, we know considerable about the Hittite empire which played such an important rôle among the great nations. Presumably through excavations other peoples of this district will become known, the knowledge of whom may compel a radical readjustment of our ideas concerning origins and the early history of Western Asia.
While, as above, the syllabary used in these Cappadocian tablets is what we call early Babylonian, it must be kept in mind that the handwriting of these inscriptions is peculiar to the district. Cappadocian tablets can usually be recognized by their general appearance. The script has peculiarities, and as mentioned, they are written in what is regarded as a dialect, under the influence of the Hittite or some other tongue of the region. The tablet with the Babylonian seal impression was scarcely written by the royal Babylonian scribe whose seal it bore. Nor is it likely that the seal belonged to a local scribe, for the names of the seal are inscribed in Sumerian. Then also, as mentioned, the art of this seal is typical Babylonian. In short, the character and contents of the documents, the forms used in the contracts, the language, the script, etc., do not show that they were written by Babylonians or Assyrians, or in the interests of Babylonians or Assyrians; but imply rather that they are the products of a civilization that may have existed for a long time in this region. Further, the custom of dating according to eponyms shows that there was already a provincial organization of an advanced order.

Among the personal names in the Cappadocian tablets there are some that have been recognized as Hittite or non-Semitic; but most of them are West Semitic or Amorite. The deities that figure prominently in the names are Amurru, Ashir (or Ashur), Ashirta, Anu, Adad, Shamash, etc. Not only do the deities show that the people are Amorite, but also the elements with which the gods' names are compounded. Not a few of these have been Babylonized, owing to the use of that language and script, but the mass of them clearly show their Amorite origin.

To what extent Western Semites moved into Asia Minor is not known. It would seem that the mines in the vicinity of Kara Eyuk would have been as attractive to them as to others. Whence came the cultural elements which these people had in common with Assyrians is a question. Probably if we had more knowledge of the early history of the intermediate country, prior to the occupation of the Mitanni people, we would have light on this problem, which for reasons given awaits solution.
XIV

EGYPT AND AMURRU

Egyptian scholars agree that there was a Semitic element that vigorously asserted itself in the beginnings of Egyptian civilization. The language of Egypt lexicographically and grammatically shows this. Also craniological research has shown that the northern Egyptian in the early period, in contrast with the southern, shows what is called a decidedly Semitic or Semite-Libyan type, the same as found on a First Dynasty representation of a Bedouin from the First Cataract. The introduction of sun-worship is also credited to this Semitic element, because it is generally supposed to have emanated from Western Asia.

It is recognized that during the dark period of several centuries from about 2350 B.C., when Memphis was given up as the capital, and the kingdom was split up into petty principalities as in prehistoric times, many Semitic loan words were introduced. It is to be noted that it was during this very period that the Amorites invaded Babylonia and established the dynasties of Nisin, Larsa and Babylon. (See Chapter VIII.)

In the first half of the second millennium B.C., an Asiatic people called the Hyksos completely dominated Egypt for a century, or, as some hold, a much longer time. Contemporaries called them "Asiatics" or "barbarians." The late traditions of Manetho call them Arabians and Phoenicians, while Josephus, in his diatribe against Apion, calls them Hebrews. When Ahmose I (1580-1557 B.C.) captured Avaris in the eastern part of the Delta, he drove them northward into Amurru. He even pursued them as far as the land Zahi (Phoenicia). It was not until more than half a century later that Thutmose III was able to break up finally the

---

1 Bondi Dem Hebräisch-phönezischen Sprachzweige angehörige Lehnwörter in hieroglyphischen und hieratischen Texten; also Burchardt, Allkanaanäischen Fremdworte und Eigennamen im Ägyptischen. (138)
coalition of the Amorite kingdoms, which had their centre at Kadesh on the Orontes.

Besides three rulers of the Hyksos who bore the name Apophis, three others are known, Khian, Khen-zer and Jacob-hur or Jacob-el. The last mentioned is Semitic, and perhaps also one or two of the others. Prof. J. H. Breasted thinks that it is not impossible that some chief of the Jacob-tribes of Israel for a time gained the leadership in this obscure age, and that such an incident would account surprisingly well for the entrance of these tribes into Egypt. This, in his judgment, would make the Hebrews in Egypt a part of the Bedouin allies of the Kadesh or Hyksos empire (HE p. 220).

Prof. W. M. Müller, in his recent work on Egyptian mythology, informs us that a very considerable part of Egyptian religious thought was derived from or was influenced by the mythology of Asia. He thinks it must be assumed that at On-Heliopolis, the earliest centre of Egyptian religion, which was situated at the entrance of the caravan route from the east, there was a constant interchange of ideas in the most remote periods. An illustration of this is to be found in the Semitic myth of the conflict between Marduk and Tiamat, the god of light and the primeval monster of the abyss, which reached Egypt after 2500 B.C., where it gave rise to the story of the gigantic serpent Apop (Ἀπόφας), the enemy of the sun-god. Müller says that only faint traces of the recreation of the world from the carcass of the abysmal dragon are found, but other ideas bearing on the conflict with the monster recur in many variants (EM 104 ff.). The introduction of this myth into Egypt in this early period, prior to the time any influence from Babylonia and Assyria had been felt, and nearly two millennia earlier than it can be shown that the Assyrians had made use of it, is a most interesting substantiation of the position taken by the writer on its Amorite origin and especially since it only appeared, as far as is known, in Assyria in the time of Ashurbanipal (Amurru 44 ff.).

In the more primitive stages of Egyptian civilization, when ancient local tradition played such an important role, Müller does

2 Petrie, it should be added, has proposed the identification of many other names of Hyksos rulers.
not think the borrowings consisted in more than the religious motifs; at least the actual names of gods in this period do not seem to have been generally appropriated. An early exception, however, was Ba'alath, the goddess of Byblos in Phoenicia, who became known and venerated in Egypt soon after 2000 B.C., when she was identified with Hāt-hōr (see EM p. 154). It seems to the present writer that perhaps Orion, whose name appears to be a formation from Uru on ānu, like Shimshôn, is also an exception. He was early brought to Egypt, where he was the "hero of the sky," and identified with the sun-god Horus, and associated also with Osiris. Doctor H. F. Lutz proposes that this deity may also prove an exception; Osiris, he thinks, is of West Semitic or Amorite origin; and was probably also borrowed by the Sumerians or early Babylonians. Among the reasons given by Lutz is the comparison of Osiris' epithet Usr wnn nfrw "Osiris the good Being" with the Sumerian or Babylonian Ašar lâ dug (often read Šiliq-lušar) which has the same meaning; and also because of the connections between the Osirian mythology and the Amorite Tammuz-Adonis myth which was introduced in Egypt as early as the Pyramid texts, 3000 B.C., or earlier. Here should be added also the fact that the Pyramid texts narrate how after Osiris was murdered by Set, a part of his body was washed ashore in a great chest at Nedyt, whither Isis his wife journeyed to reclaim it. Plutarch's narrative of the myth makes Byblos the place where his body was found. Breasted thinks this may be Nedyt, although it was later localized at Abydos. If, however, Byblos was introduced into the myth, this occurred before the thirteenth century B.C. 3 The parallel between the Babylonian Tammuz and the Egyptian Osiris has been pointed out by Baudissin (Adonis and Eshmun 1911), and others. Barton maintains that Osiris and Tammuz are independent survivals and manifestations of a primitive cult once common to both Hamites and Semites, but originally Osiris and Isis were Hamitic, while Tammuz and Ishtar had their origin in Arabia (J.A.O.S. 25 213 ff.). In the light of all that is known, however, there seems little reason for doubting that Tammuz and Ishtar are Amorite; and it is not

impossible that the Asiatic connections of Osiris and Isis, that have
been suggested, may also prove correct.

Following the Hyksos occupation of Egypt, or after 1600 B. C.,
Müller says the worship of Asiatic deities became fashionable in
Egypt, being propagated by many immigrants, mercenaries, mer-
chants, etc., from Syria. Ba' al is described as the god of thunder,
dwelling on mountains, or in the sky, and terrible in battle. Since
Ba' al means simply “lord” and is a generic title of deities in
Palestine, the kind of a god referred to was probably one like
Amurru or Adad. Other gods imported from the Amorite land
were Resheph or Reshpu, who is once called Reshpu-Sharamana,
a syncretistic formation which combines the names of Reshpu with
another Amorite god, Shalman or Shalmu: Astarte (Ashirta),
the mistress of heaven,” whose chief temple was at Memphis,
but who was also worshipped at Ramses and elsewhere: Qedesh,
pictured, like the nude goddess of Babylonia, standing on a lion
and holding in one hand a serpent, and in the other, flowers: Asit,
probably another form of Astarte; Anat, who like Astarte is war-
like and sensual; and a few other goddesses not so frequently men-
tioned, namely Atum, probably the consort of the god of Edom,
Nukara or Xugara the Amorite Nikkal (Nin-gal), Amait, etc. (EM
153 ff.).

The earliest occurrences of the name Amurru (which is written
'mwr, 'mr' and 'mr') are in the inscriptions of Ramses II (1292-
1223) of the Nineteenth Dynasty. In the early period they called
the country along the Mediterranean Retenu, which may be related
in some way to the name Tidnu given the land by the early Baby-
lonians. The country east of the Orontes, extending to or beyond
the Enphrates, was called Naharin.

Retenu with its fenced cities was looked upon by the Egyptians
as well inhabited, and civilized, but its people they regarded as vile.
Thutmose III after making a peaceful tour of inspection through
Upper Retenu had a long series of reliefs made, representing the
fauna and flora of what he called “God’s land.” The inscriptions
mention commerce and booty or tribute as coming from Retenu in
the shape of gold, silver, lead, copper, chariots wrought with gold,
malachite, feldspar, precious stones, colors, incense, myrrh, cedar,
ivory and other woods, cattle, etc. The ancient records of Egypt certainly attest the great wealth of this land.

The references to cities of Amurru are found in the inscriptions of the second millennium. How many of these cities existed in the third and fourth millennium B.C. cannot be determined. There are reasons for believing that one at least figured quite prominently in the earliest period of Egyptian history. The reference made above to Byblos in connection with the Pyramid texts (ca. 3000 B.C.), or the recognition that city received as early as 2000 B.C. in having her Ba'alath venerated in Egypt (Müller EM 154), would alone be suggestive of its importance as a great city, and probably also a very ancient one. Shechem, it should also be added, is mentioned in connection with an Egyptian campaign in the Twelfth Dynasty.

The unwarlike attitude of the Egyptians, prior to the aggression of the Semites, is responsible for the few references to the Amorite land in the early period. Few and brief as they are, they furnish us with most valuable glimpses of the civilization that existed in that land, which we have reasons for believing had a great antiquity. The fuller references occur in the later period; but even these enable us to picture the life and activity that must have pulsed in this region in the earlier millenniums.

Snefru of the Third Dynasty, at the beginning of the third millennium B.C., mentions bringing forty ships filled with cedar wood from Lebanon. This is the earliest naval expedition on the open sea that is known (BAR I, 146).

Sahure (Fifth Dynasty) about 2743–2731 dispatched a fleet against the Phoenician coast. A relief discovered at Abushir

4 These have been collected and discussed in the well known work by Müller, *Asien und Europa*. Cf. also Burchardt, *Altkanaanäischen Fremdworte*, and Paton, *Egyptian Records of Travel in Western Asia*.

6 The writer is not entitled to independent judgment as regards Egyptian chronology. The dates used are taken from Breasted's *History of Egypt*, which is in accord with the Berlin school. These are much shorter than those of Petrie and other Egyptologists who on account of certain evidences, some of which were known and believed by the Egyptians themselves, hold that the beginnings of Egyptian civilization were much earlier.
shows four of his ships filled with Semitic prisoners from the Phoenician coast cities. This is the earliest known representation of sea-going ships, and the earliest picture of Amorites who are clearly distinguishable from the Egyptian sailors.

Uni, of the Sixth Dynasty, about two centuries later, in the reign of Pepi I (2590-2570 B.C.), had been sent five times against the “sand-dwellers” of Southern Palestine. In a sixth expedition he crossed over in troop ships to the back of the height of the ridge on the north of the “sand-dwellers.” When his army reached the highway, he smote all the revolters. This is the first known Egyptian invasion of Palestine. (BAR I, 311 ff.)

The tale of Sinuhe, the Egyptian, which relates his adventures in the time of Sesostris I (1980-1935 B.C.), throws most valuable light upon Palestine in the twentieth century. This nobleman of high rank had accompanied the young coregent Sesostris on a successful campaign against the Libyans, when the news of the death of the aged king Amenemhet I reached the camp. Without any announcement, Sesostris hurried secretly back to the capital, but Sinuhe, who accidentally overheard the message, apparently for political reasons, fled eastward across the Delta into the desert. On arriving at the frontier fortress he eluded the watches on the wall. After wandering many days in the wilderness, and suffering greatly from thirst, he was finally succored by an Amorite who had been in Egypt and who recognized him. He took him to his people. Later he was sent from one land to another until he came to Byblos. He finally reached Qedem where he spent a year and a half. Then Ammi-enshi, the sheik of Upper Tenn (i.e. Retenu), brought him forth, saying: “Happy art thou with me; thou hearest the speech of Egypt,” for Sinuhe was known to the Egyptians who were with him.

He entered the service of the Amorite chieftain, became the tutor of his children, married his eldest daughter, and was allowed to select from the choicest of his lands. The goodly land named Yaa yielded figs and vines. “More plentiful than water was its wine, copious was its honey, plenteous its oil. All fruits were upon its trees. Barley was there and spelt; without end all cattle.”

Burchardt, Grabdenkmal des Königs Sahure, Vol. II.
was appointed sheik of the tribe. His children became the mighty men of his tribe. His hospitality and his consideration for caravans were such that he boasted of them. In his old age longing to see his native land, and be embalmed after death, he sent a messenger with a petition praying the Pharaoh to forgive him and allow him to return. On receiving a gracious rescript, he handed over his property to his children and set out for Egypt, where he was reinstated in high favor.

This romance which doubtless gives a true picture of life in Retenu, i.e., northern Amurru, shows what a fertile, prosperous and delightful land it was to live in.

In the time of Sesostris III (1887-1849 B. C.) of the Twelfth Dynasty, Sebek-khu, his commandant, on a marauding expedition, pillaged a place or district called Sekmen in Retenu. This is the first Egyptian invasion of northern Amurru of which there is a record. It may have been prompted by the aggressive attitude of the Amorites, to which power Egypt a little later succumbed (BAR I 680 f.).

A very important mural painting was found in a tomb of a governor of Sesostris III, named Khnum-hotep, which throws considerable light upon the land of Amurru in this era. It depicts the visit of thirty-seven men, women and children, who are Semitic Asiatics, called 'Amu. Generally the Egyptians despised the 'Amu, which is the usual designation for the dwellers of Palestine. The 'Amu are headed by the chief of the highlands, Abesha, who is depicted presenting a fine wild goat. A kilted attendant leads an antelope. The people are all richly dressed; the women besides wearing sandals are depicted with socks. One man is playing upon a lyre. Their possessions are tied to the backs of asses. The scene presents a picture of a highly civilized people, the equivalent it would seem of that which Egypt possessed, at least from their appearance. The inscription reads: "The arrival, bringing eye paint, which thirty-seven Asiatics ('Amu) bring to him. Their leader is Sheik of the hill-country, Abesha" (BAR I, p. 281). This name is the same as the Hebrew Abshai.

Ahmose I (1580-1557 B. C.), in recording the siege of the city Hatwaret (Avaris) and its capture, after which he pursued the Hyksos into Asia to the city Sharuhen (Josh. 19: 6), furnishes us
with the first glimpse of what took place following the Asiatic rule of the Hyksos, concerning which unfortunately there is such a paucity of data. According to Manetho the Hyksos made their last stand at Avaris before being driven out of Egypt. Sharuhen fell after a siege of six years. It is thought, according to a record of Ahmose-Pen-Nekkhbet, that Ahmose I then pushed northward into Syria, and invaded Zahi (B.A.R II, 1 ff.).

Thutmose I, about 1530 B.C., invaded Naharin as far as the Euphrates, slaughtering his foe, and taking numberless prisoners. On the west bank of the Euphrates he set up his boundary tablet, which fact is ascertained from the inscription of his son Thutmose III (B.A.R II, 81 ff.).

Thutmose II, about 1490 B.C., conducted a campaign in "Retenu the Upper," as far probably as Niy on the Euphrates (B.A.R II, 125).

Following a period of inactivity on the part of Egypt, the king of Kadesh succeeded in stirring up all the allied kingdoms of Zahi, including Mitanni east of the Euphrates. Thutmose III (1479-1447 B.C.) at the head of his army moved upon the strong fortress at Megiddo in the plain of Esdraelon which guarded the road between the Lebanons. Here the coalition was defeated, after which Thutmose marched northward and captured the cities Yenoam, Xuges and Herenkern, which commanded the thoroughfare between the Lebanons. These cities he dedicated to Amon.

The record of the spoil taken at Megiddo by Thutmose III throws interesting light upon the wealth of that district. He records having received 2,041 mares, 191 foals, 6 stallions, 924 chariots, 200 suits of armor, 502 bows, 1,929 large cattle, 2,000 small cattle, and 20,500 white small cattle, perhaps goats. Although the people living in the vicinity of Megiddo from whom this loot was taken can scarcely be classed as nomads, they must have possessed great wealth in herds and flocks.

On his second campaign through Palestine and southern Syria, he received submissive kings and gathered tribute. Even Assyria sent gifts. The reliefs of his third campaign, as mentioned above, depict the flora and fauna of Syria, which he brought back. Annals for his fourth campaign are wanting. On his fifth, he moved against the northern coastal cities. He captured Arvad, seized
some Phoenician ships, and returned by water. Having gained the south country and the coast on his sixth expedition, he landed his army at Simyra by the mouth of the Eleutheros, and marched upon Kadesh. This fortified city in the north end of the valley lay on the west side of the Orontes, and was surrounded by water. After a siege of several months this formidable city was captured. The balance of this season and his seventh campaign he spent in chastizing Arvad and Simyra again, and engaged from the coast towns a liberal supply of provisions for the campaigns he expected to conduct in Naharin, the district beyond Kadesh.

On his eighth campaign, two years later, he captured Qatna and Senzar. Aleppo must also have fallen, for he pushed into Naharin to the "Height of Man," where he fought a great battle. Many towns of Naharin were captured and laid waste. He then turned towards Carchemish, where he fought his foe, perhaps the king of Mitanni; after which he crossed the Euphrates into that land, and set up his boundary tablet. On his return to the west shore of the river he found the tablet of his father, Thutmose I, alongside of which he placed his own. The capture of the city of Xiy, a little to the south on the Euphrates, completed his work, after which the princes of Naharin brought tribute to his camp. Babylon, as well as the Hittites, also sent gifts at this time. Following his achievements of the ten years, he erected at Karnak two enormous obelisks which he inscribed "Thutmose who crossed the great bend of Naharin (Euphrates) with might and with victory at the head of his army." One of the pair now stands in Constantinople, while the other has disappeared.

The following year found Thutmose III again in Zahi, putting down a revolt. Two years later at Araina, perhaps in the lower Orontes valley, he defeated another coalition formed by his Naharin foe. Several years after this he again chastised South Lebanon; at which time Cyprus, Arrapahitis and the Hittites paid tribute. His seventh and last campaign was occasioned by Kadesh inciting his allies of Naharin and especially the king of Tnup to revolt, which resulted in the destruction of that city and the subjugation of the country (B.1R II, 391 ff.).

The most important record bequeathed to us by Thutmose III was inscribed on one of the pylons of Karnak, containing his
annals, in which long lists of peoples and Amorite towns are found. The striking fact is that in spite of all the vicissitudes which this land suffered through conquests and migrations, many of these names were in use in late Biblical times, and remain unchanged at the present time. This fact, considered in connection with the knowledge that some cities are known in the early period, suggests the idea of a much greater antiquity for the civilization than is generally recognized.

Amenhotep II (1448-1420 B.C.), the son of Thutmose III, reigned but one year, when all Naharin and Mitanni revolted. Early in May of the following year he fought at Shemesh-Edom against the princes of Lebanon, whom he defeated. A little later, after a skirmish near the Orontes, he reached Niy, which city acclaimed him its sovereign. He punished the city of Ikathi, and at Tikhsi he captured seven princes of that district, whom he hanged on reaching Egypt. As his father and grandfather had done, he set up a memorial tablet somewhere in Naharin marking his northern boundary. In the vicinity of Napata he set up a stele marking his southern boundary. He drove before him in triumphal procession, as he proceeded to Memphis, 550 nobles, 240 wives, golden vessels to the weight of 1660 pounds, copper, nearly 100,000 pounds, 210 horses and 300 chariots (BAR II, 780 ff.).

Thutmose IV (1420-1411 B.C.) apparently maintained the boundaries of the Asiatic empire established by his father. Mention is made of Naharin, against which one campaign was conducted. He refers to cutting cedars in Retenu, and proclaimed himself "conqueror of Syria." His father had secured for him in marriage the daughter of Artatama, king of Mitanni, in order to strengthen his alliance with that country. She was named Mute-muya in Egypt; and became the mother of the successor to the throne (BAR II, 820 ff.).

Amenhotep III (1411-1375 B.C.) was the last of the great emperors. He married an untitled woman named Tiy, who occupied a position of great influence during the reign. Circumstances were such that he was not obliged to carry on warfare with Amurru, for he had little occasion for anxiety from his subjects. He enjoyed unchallenged supremacy throughout Syria, Babylonia, Assyria, Mitanni, and Alashia, with whose rulers he maintained
the friendliest of relations. We learn this, not from his monumental records, which throw little or no light upon the situation, but from the so-called Amarna Letters which contain official correspondence between this ruler and his successor, on the one hand, and on the other the rulers of the nations referred to. It was only in the latter days of his long reign that trouble appeared in Syria. Hittites from Cappadocia invaded Mitanni, and the provinces of Egypt on the lower Orontes, and began the absorption of Syria. Vassal Amorite princes were in the conspiracy, and Ubi, the region of Damascus, was threatened. The Hittites and the Ḫabiri, their allies, mercenaries or subjects, began to invade the land.

During the reign of Amenhotep IV (1375-1358 B. C.), the heretical king who assumed the name of Ḫmaton, the dissolution of the Asiatic empire took place, and it was finally absorbed by the Hittites. On his accession Dushratta of Mitanni and Burra-Burash of Babylon sent greetings and sought friendly relations with the Pharaoh. Seplel (written Shubbišlušma in cuneiform), king of the Hittites, did the same and sent gifts, but apparently Amenhotep had little desire of maintaining the old relations with Seplel, for the Hittites had already begun to encroach upon his land. With the assistance of the unfaithful vassal Abdi-Ashirta and his son Aziru, who headed an Amorite kingdom on the upper Orontes, and Itakama who had taken Kadesh, the Hittites, with the aid of the Ḫabiri, steadily advanced southward. The faithful vassals of the Pharaoh one after another succumbed until the entire land was lost to Egypt (see also Chapter XII). Besides the Amarna letters, a single Egyptian monument of this reign gives instructions regarding the disposition of Asiatics whose towns had been plundered and destroyed, and who had come to settle in Egypt (BAR III, 10 f.).

Seti I (1313-1292), after the lapse of half a century, records his chastisement of the Bedouin in southern Palestine, who were making common cause against the Palestinians. After this he captured towns in the plain of Esdraelon, and erected a victory tablet in the Hauran; at which time the princes of the district came to him and offered their allegiance. Two years later he is found storming a walled city in Galilee called Kadesh, which had been founded by the Amorites Abdi-Ashirta and Aziru; and later he
pushed northward against Merasar (Mursili), son of Seplel, king of the Hittites, whom he met in the Orontes valley. It does not seem that any important decision was gained, except that the movement of Hittites southward was checked. Later he made a treaty of peace with Metella (Mutallu), who had succeeded his father Merasar (BAR III, 82 ff.). A few miles south of Tell Ashtarah in Bashan a stele has been found in which Seti I is represented offering a libation to Amon.

Ramses II (1292-1225 B. C.), about twenty years after the attempt of Seti I to wrest the land from the Hittites, made his first move against Metella. This occurred in his fourth year, when he seized Kadesh on the Orontes. He left evidence of his activity near Beirut in the shape of a stele cut into the rocks overlooking the Nahr-el-Kelb (Dog River). Metella by the aid of the kings of Naharin, Arvad, Carchemish, Kode, Kadesh, Nuges, Ekereth, and Aleppo, besides drawing upon his allies in Asia Minor, amassed a great army. The battle of Kadesh which followed is the first in history whose strategy can be studied. The Hittite king by cleverly masking his manoeuvres, flanked Ramses, who was taken unawares. The battle was undecisive, yet Ramses returned to Egypt and celebrated the event as a triumph. Several years of campaigns followed. Naharin was conquered as far as Tunip. After about fifteen campaigns the Hittite king died, and Ramses made peace and a treaty of alliance with Hetasar (Hattusil), his successor, which continued effective throughout his long reign (BAR III, 316 ff.).

Merneptah (1225-1215 B. C.) was advanced in years when he came to the throne. Not long after his ascension he discovered that the northern Mediterranean peoples, called by the Egyptians, “peoples of the sea,” among whom were the Theka and Peleset (Philistines), together with allied peoples, were making incursions from the north and especially Asia Minor; and were plundering his territory in coalition with the Libyans, who were encroaching upon Egypt. This movement resulted in the decline of the Hittite power in the north, with whom the Egyptians had no further conflict.

In a poetic encomium celebrating his victory over the Libyans, without mentioning his allies from the north Merneptah makes
reference in the last section to Israel. It reads: ‘The kings are overthrown, saying Salam! Not one holds up his head among the Nine Bows. Wasted is Tehenn, Ïta is pacified; plundered is Pekanan (the Canaan) with every evil; carried off is Askalon; seized upon is Gezer; Yenoam is made a thing not existing; Israel is desolated, his seed is not; Palestine has become a widow for Egypt; all lands are united, they are pacified; every one that is turbulent is bound by King Merneptah, giving life like Re, every day.’

In a letter from a frontier official, mention is made of Edomite Bedouin being allowed to live near Pithom (cf. Gen. 47: 1-12), in order to pasture their cattle (BAR III, 623 ff.).

Rameses III (1198-1167 B.C.) records in relief, scenes of his invasion of Northern Syria and Asia Minor. It shows him storming five strong cities, one of which is called ‘the city of Amor,’ another presumably is Kadesh surrounded by water (BAR IV, 59 ff.).

Sheshonk (945-924 B.C.) is the first Pharaoh mentioned by name in the Old Testament, who in the fifth year of Rehoboam invaded Palestine (1 Kgs. 14: 25). On a large relief found at Karnak he gave a list of between fifty and sixty names of towns in Israel and about one hundred in Judah. Of the total number only about seventy-five are preserved, of which seventeen can be identified. Bêth 'Anath in Galilee is the most northern city recognized; and Arad in Judah the most southern (BAR IV, 709 ff.).

A study of the Egyptian monuments of the early period tends to show that considerable influence was exerted from Amurru, where in important centers a civilization of a high order existed already in an early age. It is recognized that emigrants poured also into Babylonia and Assyria. Politically Amurru is not known to have come into contact with Egypt in the early period; nevertheless, it is not impossible, as stated in a previous chapter, that one or more of the dark periods in Egyptian history are to be explained as being due to encroachments of the Amorites, as we have definite proof, occurred in the history of early Babylonia.

In the period prior to the Hyksos rule, that is, before 1700 B.C., there is no evidence from the Egyptian monuments to show that
there was any kind of a political union of the different principalities of Amurru. This is due to the extreme paucity of references to the country on the monuments. The Hyksos movement unquestionably must have represented united activity on the part of Amorite kingdoms. Following their expulsion, there can be no doubt but that the Amorite cities of the Mediterranean region were leagued together in resisting the invasion and conquest of the land by Thutmose III.

A study of the Egyptian monuments of the second millennium, without any knowledge from other sources, reveals a stability and permanency of civilization in Amurru that suggests a very long period of development. The stubborn resistance offered the Egyptian hosts by the walled cities, the way their strength from time to time was revived, the amount and character of the booty taken, the enormous tribute received by Egypt, the knowledge we have of the commerce carried on, besides many other considerations, tend to confirm the idea that the civilization of Amurru had a great antiquity; and that back of the earliest traces of it, there was a chain or development which covered many centuries.
The Amorites are regarded in the Old Testament as pre-Israelite inhabitants of Palestine; where we get the correct impression that their history largely belonged to the past. The term Amorite is used as having an ethnic signification, but it was also used frequently in a collective or geographic sense. The Canaanites lived along the coast, and the Amorites in the hills or high ground (Josh. 5:1 etc.); but the terms are frequently used synonymously (Gen. 18:22 etc.). In some instances all the inhabitants of the land, the Hittites, Jebusites, Hivites, etc., are designated as Amorites (Josh. 7:7), even the Philistines (1 Sam. 7:14); and in other instances the Amorites are listed among the different peoples of the country (Josh. 24:11).

The earliest reference in the Old Testament to the Amorites is found in the narrative of the Elamite campaign to Palestine and the country to the south of it. This took place during the short period when Elam was dominant in Babylonia, in the latter part of the third millennium B.C. Chedorlaomer (Kudur-Lagamar), king of Elam, was accompanied by Arioch, king of Ellasar (Larsa), Amraphel (Hammurabi) king of Shinar (Babylon), and Tidal king of Goyyim (perhaps Guti), (Gen. 14:1). These kings made war with Bera, king of Sodom, Birsha, king of Gomorrah, Shinab king of Admah, Shemeber king of Zeboiim, and the king of Bela (the same is Zoar). All these joined together in the vale of Siddim (the same is the Salt Sea). Chedorlaomer and the kings that were with him smote the Rephaim in Ashteroth-Karnaim (probably Tell Ashtara in Bashan), the Zuzim in Ham, the Emim in Shaveh-kiriathaim, and the Horites in Mount Seir, unto El paran, which is by the Wilderness. These kings returned and came to Em-nishpat (the same is Kadesh) and smote all the country of the Amalekites and also the Amorites that dwelt in Hazazontamar. The latter place is identified in 2 Chron. 20:2 with En-gedi, which
was situated in the high cliffs at the mouth of the gorge of Wady Ghôr running into the Dead Sea at about the middle of the west bank. Some scholars, however, identify it with Thamara between Elath and Hebron. Kadesh has been identified about fifty miles south of Beer-sheba. When the Israelites came to Kadesh-barnea it is said that they had reached unto the hill country of the Amorites (Deut. 1:19,20). Sihon’s Amorite kingdom is said to have reached unto the Gulf of Akabah (see below). This invasion, it would seem, passed through the country on the east side of the Jordan and the Dead Sea, and extended southward. If the identification of Humurtu with Gomorrah should prove correct, the Babylonian army of Dungi at an earlier time had also visited this region. Certainly as stated above, the title “king of the four quarters,” which he acquired, points to activity in Amurru.

The statement that Abram dwelt by the oaks of Mamre, the Amorite, brother of Eshcol and Aner (Gen. 14:13), refers to Amorites living near Hebron in southern Palestine (Numb. 13:23 b).

“The land of the Moriah” whither Abraham was commanded to take Isaac and offer him for a burnt offering upon one of the mountains, seems to refer to the Lebanon district. In his journey, “on the third day he lifted up his eyes and saw the place afar off.” The Peshitto version reads “the land of the Amorites” instead of “the land of the Moriah.” The Septuagint translator not understanding the text, used the words “the highland.” The writer of 2 Chron. 3:1, who refers to “the mountain of the Moriah,” apparently having the temple hill of Jerusalem in mind, seems to have based his statement upon this passage after the name had been corrupted. The Septuagint version here reads it correctly “of the Amorites.” The Hebrew in both instances has the article, “the Moriah.” If the shortened form Moriah had actually been used as well as Amoriah, it would be an interesting parallel to the name in cuneiform, where the initial letter also in some instances has disappeared (see Chapter VII).

Isaac before dying informs Joseph that he had given him Shechem which he had taken from the Amorites: “I have given to thee Shechem above thy brethren, which I took out of the hand of the Amorite with my sword and bow” (Gen. 48:22). This tradition apparently alludes to the capture of that city by his sons.
There is a Jewish legend which tells of an attack made by seven Amorite kings upon Jacob at Shechem, and of his victory over them (Jubilees 34, 1 to 9).

The Amorites in the time of Moses continued to be dominant on the east side of the Jordan and the Dead Sea. The river Arnon flowing into the Dead Sea "was the border of Moab between Moab and the Amorite" (Numb. 21: 13). Sihon king of the Amorites refused to let Israel pass through his border; and Israel smote him and took his land, from Arnon to Jabbok, even unto the children of Ammon. Israel dwelt in all the cities, in Heshbon the city of Sihon, and all the towns thereof (Numb. 21: 21-26).

Jazer, another city of the Amorites in this district, is also mentioned by name as captured (v. 32). And Israel "turned and went up by way of Bashan, where Og king of Bashan came out against them." He also was defeated, and Israel possessed his land (vv. 33-35).

Although Og, king of Bashan, is called a king of the Amorites, it is said he "remained of the remnant of the Rephaim," a great race of that district.

The territory of these "two Amorite kings" is said to have extended from Aroer on the edge of the valley of Arnon even unto Mount Sion (also called Sirion and Senir, i.e. Hermon), and all the Arabah unto the sea of the Arabah (which is the Gulf of Akabah) (Deut. 3: 8 ff. and 4: 47-49). The two kingdoms therefore included Bashan, Gilead, Moab, and Edom to the Gulf of Akabah, a region of no small extent.

After the Amorites beyond the Jordan had been conquered, Israel crossed the Jordan and came to Jericho, fought and defeated the men of Jericho, the Amorites, Perizzites, Canaanites, Hittites, Girgashites, Hivites and Jebusites (Josh. 24: 8-11, 15 and 18).

On the west of the Jordan, Joshua and the inhabitants of Gibeon, who are said later in the time of David to be of the remnant of the Amorites (2 Sam. 21: 2), fought and defeated five Amorite kings, namely Adoni-zedek of Jerusalem, Hoham of Hebron, Piram of Jarmuth, Japhia of Lachish, and Debir of Eglon (Josh. 10: 3 ff.).

The older population of Judah being called Amorite throws light on the passage in Ezekiel concerning Jerusalem: "the Amorite was thy father and thy mother was a Hittite" (Ezek. 16: 3).
The Amorites also dwelt in Heres, Aijalon and in Shaalbim, and tried to force the children of Dan into the hill country, but the latter prevailed and made them tributary (Judg. 1:34 ff.).

While we have knowledge of a number of petty principalities of the Amorites on the west side of the Jordan there is no evidence of a kingdom or kingdoms such as those of Og and Sihon on the east side. When excavations are conducted in this region there may be discovered remains of a much earlier Amorite civilization than has yet been found in Western Palestine.

Unfortunately only a few names borne by Amorites are mentioned in the Old Testament. Some of these like Adoni-zedek, Japhia, Debir can be said to be Semitic, while others remain undetermined. The same can be said of the five kings mentioned in the Elamitic campaign (see Chapter II).
XVI

ASSYRIA AND AMURRU

The country of Assyria, owing to its proximity to Amurru, seems to have been extensively influenced by that land. This follows from a study of the religion and nomenclature of the Assyrian inscriptions both early and late. Not only was the country settled by Amorites, but they kept pouring into it in various periods, as they did into Babylonia, and Egypt.

In spite of the fact that the excavations conducted in Assyria have not been inconsiderable, little has been found that throws light on the beginnings of the land's history. The inscriptions of Shalmaneser I and Esarhaddon furnish us with references to an early king named Ushipia (also written Aushpia), the traditional builder of E-harsag-kurkurra, the temple of Ashur; and to Kikia, who is regarded as the traditional builder of the wall of Ashur (Chron. I 122, 140). Also in a late chronicle we learn that Tlu-shuma, king of Assyria, marched against Su-abu, who is considered to be Sumu-abum, the founder of the First Dynasty of Babylon (ibid. I p. 129). The first contemporaneous record bearing upon Assyria from Babylonian sources is a military despatch of Hammurabi, which refers to his troops and the country of Assyria (LIH III p. 14), which in this period was subject to Babylon.

The earliest known references to Assyria in the inscriptions belonging to such a comparatively late period, the question as to the origin of its civilization has frequently been touched upon. Heretofore it has been customary, with the Biblical tradition of Nimrod, to regard it as having been an offshoot from Babylonia, largely because of the script and language and certain cultural elements.1 The early inhabitants of the country, whether Semitic or non-Semitic, did make use of what we call the Semitic Babylonian language, and the Sumero-Akkadian system of writing.

1 See Rogers History of Babylonia and Assyria (II 133 ff.).
Moreover the Sumerian temple names, the many Sumerian terms used for religious rites, etc., point unmistakably to Sumerian influence at some previous time; but whether this was by direct contact with the Sumerians or indirectly by contact with the Semites who lived in Eastern Amurru, who had been influenced by the Sumerians, or from both sources, cannot be determined.

The excavations conducted by the Deutsche Orient-Gesellschaft at Kalah-Shergat, the site of ancient Ashur, on the Tigris, yielded besides inscriptions, the earliest known antiquities of that land. In the lowest stratum, which was separated by charred debris from the one above, there were found several pieces of rude sculpture which are suggestive of the work of the Sumerians, familiar to us from the excavations in Southern Babylonia. The inlaying of the eyes with shell, the Sumerian physiognomy, the shorter head, and the treatment of the garments, make it reasonable to think that prior to the period when the foundations of the temple of Ishtar at Ashur were laid, the people were under the influences of the Sumerian civilization, which prevailed in Babylonia at the same time (see King HB 137 f.). Whether the Assyrians were under the influence of the Sumerian craftsmen in their original home, before they settled Assyria, is another question that cannot be determined at present.

In Amurru 138 ff., the writer proposed, after a consideration of the use of certain West Semitic deities in the early names of temples and individuals, that the early Assyrian culture, with which we are familiar, arose, or was extensively influenced by migration from the West. It is interesting to note that recent publications of Johns and King accord with this idea. This is also accepted by Luckenbill; who, however, holds that the earliest Semites of Assyria were borne in on what he calls the first of the successive migrations from the desert of Arabia into the Euphrates Valley, which movement of Semites brought Sargon and Naram-Sin (ca. 2500 B. C.) into Babylonia, when supremacy was for the first time gained by them (see AJSL 28, p. 154). With this view the writer feels constrained to differ in every detail, as is evident from the results presented in this work.

Johns Ancient Assyria p. 10; King HB p. 137.
It has been suggested that the two earliest known traditional rulers, Ushpia and Kikia, were Hittite-Mitannian (cf. Ungnad B.A VI 5 p. 13). If this is correct, no other influence from this quarter has been pointed out. It is not impossible that the Mitanni people had already pushed into Aram. It would seem that these kings lived prior to the time of the Ur Dynasty, for the rulers of Ur, who bore the title “king of the four quarters,” would hardly have permitted an encroachment upon the territory north of Akkad. Since Ka(?)-sha-Ashir and Shalim-ahum preceded Ii-shuma (KTA 60), who is thought to have been a contemporary of Sumu-abu, founder of the Amorite First Dynasty of Babylon, the beginning of their reigns would be near the time the Amorites established themselves on the thrones of Nisin and Larsa.\(^3\) Probably there was at least a fresh ingress of Amorites at this time.

If the Semites who lived in Assyria prior to this period were Babylonians, they have left no traces of their culture which can be said to be peculiarly their own, except the use of the language and script. In an inscription found at Ashur, Ashir-nirâri (about 1800 B.C.) calls himself “the builder of the temple of En-lil-lâbîra.” Some may incline to cite this as an example of influence from Babylonia. As stated below in Chapter XVII, En-lil “lord of the storm” is very probably another designation of the Amorite storm-deity. This is confirmed by the reference of Tiglath-pileser I to this very temple in Ashur, in which he mentions it as “the temple of the god Amurru, the temple of the elder Bêl, the divine house” (King Annals p. 87). The passage becomes intelligible if we understand it to mean that Amurru is the elder bêl mâtâti, or Enlil.

The god Ashir or Ashur is not known to have been worshipped in early Babylonia. In Cappadocia, at a time probably contemporaneous with the Ur dynasty, hence earlier than the earliest Semitic inscriptions at present known from Ashur, the deity was very prominently worshipped. Besides, as referred to (see Chapter XIII), the two regions had certain customs in common; and we

\(^3\) Esarhaddon refers to a king Ellil-bâni, son of Adasi, who was made a ruler by Ura-imitti, but he seems to have been the ruler by that name of the Nisin dynasty, in other words a Babylonian.
have reason for believing that either the one locality influenced the other, or there was an intermediate civilization, of which we have at present no trace, that influenced both. As mentioned also, the names of the early rulers of Assyria, being constituted with the Amorite gods Ashur, Adad, Dagan, and Shamshi, show that they were probably Amorite. Besides, the earliest temple of which we have knowledge was erected to Adad and Anu, who were also Amorite gods (see Chapter XVII).

The earliest known Assyrian king who records that he came into contact with the land Amurru was Shamshi-Adad III, who ruled about 1600 B.C. He calls himself šar kiṣṣati, which is usually translated "king of the universe," and informs us that he devoted his energies to the region between the Tigris and the Euphrates (KT.1 2 Obv. 5-9). Further, he states that he set up a memorial stele in the country of La-ab-a-an (Lebanon), on the shore of "the great sea" (the Mediterranean) (KT.1 2, IV: 13 ff.). He does not mention having had any conflict in this part of the land, which would indicate that he probably ruled prior to the time the Hyksos were driven out of Egypt, after which Western Amurru became tributary to that land.

Ashur-uballit, who lived about 1400 B.C., is credited by a descendent with having conquered the lands of Shubari, Musri, etc. (KT.1 3 Obv. 33 and 4 Obv. 25). His grandson Arik-dēn-ilu conquered the bordering lands to the west and north-west of Assyria, including the Aramaeans (Ahlami), and Sutti peoples (KT.1 3 1: 21). Adad-nirāri II, his son, about 1300 B.C., who called himself "king of the universe," conquered many strongholds along the Euphrates, including Harran as far as Carchemish (KT.1 5 Obv. 13). Shalmaneser I also makes the same claim (KT.1 13 Rev. III: 4). Tukulti-nurna, about 1260 B.C., claimed to be "king of the universe, king of the four quarters" (KT.1 17 Obv. 1-2), the latter title being more comprehensive than the former.

The four quarters, as is well known, embraced Akkad on the south, Shubartu on the north, Elam on the east, and Amurru on the west; but the latter country could only have been conquered in part, for it was during this time that the Egyptians and the

4 For translations of these texts, see Luckenbill AJSL 28, 167 ff.
Hittites were contesting for the supremacy of the land along the Mediterranean; and in fact no mention is made of Assyria being involved in any of the references to the control of this territory in the Egyptian inscriptions (see Chapter XIV). From a little later on, in the time of Tiglath-pileser I, about 1100 B.C., references to this part of Amurru are found in that ruler's inscriptions.

Amurru, with Mitanni already occupying Aram, it would seem, in the sixteenth century was dominated completely by neighboring powers. The Hittites had encroached upon the land from the north and the north-east; Egypt, after driving back the Hyksos, controlled the western part of the country along the Mediterranean to the Euphrates, even crossing it; and Assyria had continued to hold by raids or conquests at least part of the eastern region. While the Egyptians and the Hittites came into conflict over the western lands, Egypt and Assyria do not seem to have experienced any difficulties with each other; although Assyria, desiring to be on friendly terms with Thutmose III, sent costly gifts, which were interpreted by the Egyptians as representing tribute. The friendship of Egypt also seems to have been greatly desired by both Assyria and Babylonia in the time of Amenhotep III, as is shown by the Amarna letters. Moreover, the Assyrian inscriptions of the latter half of the second millennium show us that repeated conquests were necessary to maintain supremacy in the part of Amurru which that nation tried to hold.

Shamshi-Adad, the earliest ruler mentioned above who claims to have been solicitous for the welfare of the land between the Tigris and the Euphrates, is doubtless the ruler bearing that name who built the temple at Tirqa on the Euphrates (see Chapter X). He is the only early Assyrian king who claims to have done more than conquer and subdue; and it must be admitted that it is an interesting discovery to have found evidence of the constructive activity of this Assyrian king in this region in the shape of the votive tablet referred to in Chapter XI.

In the inscriptions of the following period we learn that Tiglath-pileser I (about 1125-1100), who had extended greatly the territory of Assyria, sailed in ships of Arvad upon the Mediterranean; which he called "the great sea of Amurru" (KB I 48: 8). Although the title "king of the four quarters" included Amurru
(see above), Assyrian inscriptions prior to this time do not mention the name Amurru. Ashir-bêl-kala in his inscription mentions the gods of Amurru (King AKD p. 153). Ashur-nâšîr-pal refers to the great sea of Amurru, and to receiving tribute from the kings on the shore of the sea from Tyre, Sidon, Byblos, Maḥallata, Maiṣa, Kaiṣa, Amurru, and Armada (KB I 108: 85 and 86). Adad-nîrâri III says he conquered Ḫatti, Amurru, Tyre, Sidon, Edom, Omri (Israel) and Samaria (KB I 190: 11), showing that he did not include Palestine in Amurru. Sargon informs us that he ruled the wide land of Amurru, in which he included Ḫatti and Damascus (X: 17, XIV: 22, 46; Annals 52). Sennacherib considers that Amurru included the cities of Philistia and Phoenicia, as well as Bêth-Amon, Moab, and Edom (KB II 90). Ashurbanipal also included Palestine in Amurru.\[^{5}\] The references show that in the Assyrian inscriptions of the first millennium the confines of Amurru varied, and the name had an uncertain signification, the same as in the Old Testament; moreover, the name is usually found with the gentilic ending as in the Old Testament.

\[^{5}\] See Tofteen AJSL 1908 p. 31.
The Deities of Amurru

An exhaustive study of the religions of Amurru would embrace not only all the ancient inscriptions that have been discovered in the land, including the Old Testament, but all the light that can be gathered from contemporaneous sources. It would include also certain elements of belief that survive at present, which represent the unconscious inheritance of previous millenniums: also sacred sites, objects, rites and practices.¹

The purpose of the present effort being to establish the existence of an antiquity for the Amorite civilization and to show its influence upon other nations, it must suffice to discuss briefly only such details of the early history as the contemporaneous records offer; and instead of attempting to reconstruct the religion of the Amorites, which at the present would be an impossibility, little more can be done besides presenting the knowledge that we have of the prominent deities that they worshipped. In such a review it is necessary to bear in mind that many different nations or tribes occupied this territory, some of which were non-Semitic. To what extent these peoples’ religion influenced the Amorite, and whether any of the deities we now consider as Semitic were foreign, cannot be determined. Then it is known that different petty principalities, as in Babylonia, had their own and distinct names for gods who were worshipped in other districts under other names. The fact that so many of the deities of the land were storm-gods, and were identified with each other, would seem to confirm this. Even Jahweh was regarded by the Hebrews as a storm-deity, a god of the mountains. Certain groups of deities are mentioned in the Aramaean inscriptions, as for example in the Panammu inscription, Hadad, El, Resheph, Rekeb-el, and Shamash; it is nevertheless

¹ Small but valuable compends of the early religion of Canaan are Cook The Religion of Ancient Palestine, and Paton The Early Religion of Israel.
impossible at the present time to attempt a reconstruction of a pantheon or pantheons—in fact, it is possible to do little more than discuss in some instances the attributes of the gods, and set forth in a general way the facts that can be gathered concerning them. But this knowledge coming from contemporaries who had adopted the deities, or referred to them, very often shows such modifications of what is usually regarded as the original conceptions of the deities, that its value appears to be only relative in arriving at permanent conclusions concerning the sex, nature and attributes of the Amorite gods.

In not a few instances it has been ascertained that the character of gods was changed after they had been transported to other lands. These changes may have been due to various causes. The deity of the mountains when brought into the plains would gradually lose his mountainous character. A storm-god transported to a rainless land would naturally have other attributes emphasized. If Ea is Amorite, as is claimed, and the ideogram En-ki, "lord of the earth," is an indication of the nature of the god in the country where he was indigenous, we can only conclude that it was when brought to Eridu in southern Babylonia, a city that had been built on land regained from the sea, that he became a god of the springs and the deep.

Rivalry, prejudice, or contempt may have been responsible for a deity's being regarded quite differently in a foreign land from the way he was regarded in the land where autochthonous. Urra in Babylonia was looked upon as the god of pestilence, plague, destruction, etc. Ne-Uru-Gal, Urra-Gal, or Urru, the Nergal of Cutha, was the god of the underworld as well as of plague and pestilence. If Cutha was a Babylonian city of the dead, we should have a reason for this conception of the deity. He, as well as other deities, who originally partook of the same nature as the god Uru or Urru or Amurru, are gods of war like the storm-god Adad (see below). A storm-deity is naturally a god of destruction, as well as one who has considerable to do with vegetation. It would seem reasonable to infer that the idea that this deity was a god of plagues, pestilences, and death had developed in the land which had from time to time suffered violence at the hands of the hordes who worshipped him. Such a god of the invaders, perhaps ruth-
less, was regarded as rašubbu, "the terrible." Nergal, although adopted in the Babylonian pantheon, may have continued to be recognized as a god of the West. With this understanding it is not difficult to comprehend how a god of the Amorites, who had again and again invaded Babylonia, would be regarded as such a deity. Doubtless the same conception arose in the West concerning the Babylonian and Assyrian war gods, who had brought calamity so often upon the people; but unfortunately we have no way at present of determining this.

Another modification which the original character of certain deities suffered was the change in sex, a question which Barton and others have fully discussed. (See Semitic Origins pp. 120, 191 ff. etc.). When the goddess Ashirta was carried into Arabia, she became the god Athtar; and the god Shamash became a goddess. In the Nippur Name Syllabary it would seem that Shamash in the name Tu-li-id-4šamši(-ši) (UMBS XI 1, 39) was also regarded as feminine. Urta, the goddess of the Amorites in Babylonia, became masculinized, although the name In-Urta stood for a goddess as well as a god (see below).

Some scholars see in this transformation of sex the idea of the combination of the two principles, male and female. True, Venus was credited with an androgynous character by certain ancient writers of the late period, but the existence of a hermaphrodite in the Semitic world is yet to be proved.

In the development of theological systems in the various Babylonian centres we find many attempts at identifying one god with another. Such a practice was perfectly natural in a land into which foreign gods were constantly filtering. As a result the syllabaries of deities contain many syncretistic formations, such as Uru-Mash, Shar-Maradda, Shar-Girru, Nannar-Gir-Gal, Amaru-Utug, etc. Such formations were known also in the West, as Ashtar-Chemosh, Hadad-Rimmon, 'Attar-'Ate, Iwr-Mer, Bir-Dadda, Giri-Dadda, Jahweh-Sabaoth, Jahweh-Shalom, etc.

As is well known the generic designations or titles as El "god," Ba'al "lord, owner," with its corresponding feminine form Ba'alat, were used in connection with deities of different localities. It seems Malik or Melek, probably the same as Molech of the Old Testament, was another such appellation. In only a few instances
can the names of the deities who are represented by such designations be surmised; to cite a single example, the Ba'alph of Ḫarran was the moon god Sin. In Egypt Ba'alph became the name of a deity, as was Bēl, another name for Marduk in the Neo-Babylonian period. Adōn "lord" is another such term. This element appears frequently in Assyrian texts, as A-du-na-i-zī, A-du-ni-ba'-al, A-du-ni-il-i-a, etc. Abu "father" is found in many Old Testament names like Ab-rām, Abi-hūd, Abi-melech, Abi-shī'a, etc., where, as in other Semitic lands, it is used as a substitute for the name of a deity. 'Am written in cuneiform Amma, Hammu, etc., which some regard as a designation of "the father-uncle," borne by the husbands of a wife when polyandry was practiced, is also used instead of a deity in personal names, cf. 'Am-ram, 'Ammi-el, 'Ammi-ḥud, etc.²

In view of the fact that the name of Amurru or Uru is the same as that of the land, and that Aloros "god Uru" stood at the head of the Chaldean mythological list of antediluvian kings, it would seem that the god Amurru or Uru was the head of the pantheon of Amurru. Nevertheless, because of our very limited knowledge of the Amorite religion it seems best at this time to consider the deities alphabetically.

Adad is one of the most prominent deities of the Western Semites. He is known in the Old Testament as Hadad. The name is found written in cuneiform: A-da-ad, Ad-du, Ad-di, A-ad-da, A-da-di, A-da-da, Da-ad-da, Da-di, Ha-di, etc. Another name of this deity, perhaps arisen as an epithet, is Ramman, also written Rāminu, Rimmon, Pērāw (2 Kgs. 5:18), etc. (see Deimel Pantheon Babylonicum, 43 f.).

Adad, together with Shamash, figures prominently in the Hittite treaty, where both bear the title "lord of heaven." In one of the Amarna letters, Abimelech, king of Tyre, likens the Pharaoh to Shamash and Adad. In the Aramaic inscription of King Panammu of northern Syria (eighth century), he is mentioned at the head of a list of five gods; Hadad, El, Resheph, Rekeb-el, and Shamash. In Assyria and Babylonia, to which lands they were carried, Shamash and Adad were lords of divination. In Assyria

² See Paton's article on 'Amm in Encyclopaedia of Religion and Ethics.
a common name for the early rulers was Shamshi-Adad. The name may mean “My sun is Adad,” but it also may mean “Shamash is Adad,” a syncretistic formation, many examples of which have been found in Amurru (see above). There are other deities of the West lands, including some that are not Semitic, that have been likened to Adad of Amurru, namely Dagan of Amurru, Teshub of Su^i, Adgi of Suh^i, Il-Ħallapu, Ilu-We-ir.3

We are dependent for our knowledge of the nature of Adad largely upon the inscriptions of Babylonia and Assyria, where he was regarded as the weather-god, the god of the tempest, inundations, lightning, and thunder. Gods as well as men seemed to stand in awe of him because of his power over the elements. He was the lord of abundance at the same time that he was of want and hunger, which resulted from his withholding the rain. His destructive power made him an appropriate war-deity; and we find Hammurabi speaking of him as “the mighty bull who gores the enemy.” Doubtless, Adad is meant by the picture of the powerful bull breaking down the fortress representing a deity in an Egyptian scene. It should be added that Adad’s close association with Shamash, especially because of the very common combination Shamshi-Adad in names, and other facts, show that attributes of a solar-god were blended with those of a storm-deity in Adad.

Adad, unlike several other West Semitic deities, although brought into the Babylonian pantheon, was not identified with any particular centre in Babylonia, at least as far as is known at present. In Assyria his position was different, for one of the earliest temples was erected to Anu and Adad. Later, Ashur supplanted Anu, and the two prominent deities of the land became Ashur and Adad.

In the art of the seal cylinders, Adad is frequently seen resting his foot upon a bull, or standing entirely upon the animal, which he leads by a leash attached to a ring in its nose. In the same hand he holds a thunderbolt; the other hand is usually held against the breast. The many devotees of Adad (~IM) among the Amorites

3 See CT 25, 16 and 17 etc., but especially in connection with the many forms in which the god Amurru or Uru occur (Chapter VII).
living in Babylonia, as is shown by the impressions of seal cylinders in the time of the First Dynasty, is an indication as to how extensive was the worship of the deity at this time.

Adgi is a name of the storm-god Adad in the land of Sulji, according to the list of gods CT 25, 16: 19. It occurs in the name Ad-gi-ilu of the Assyrian documents (ADD 17: 3), and in the name Ad-gi-ši-ri-za-bad-du of the Murashu texts (BE X 55: 1), which is also written in the Aramaic endorsement on the tablet. In the latter name the god seems to be syncretized with Siri, namely Adgi-Siri.

Amurru or Uru. It has been previously maintained by the writer that the name of the West Semitic deity Amurru or Uru, when brought into Babylonia by the Semites, was written differently in different centres. For example, at Babylon the name appeared Amur-Utug, probably a syncretistic formation: at Cutha it was written Ne-Uru-Gal, Uru-Gal, etc. On the ideographic and phonetic writings of the name, see Chapter VII.

In studying the inscriptions of the seal impressions on tablets dated in the time of the First Dynasty, one is struck with the number of individuals who acknowledged obeisance to Amurru (dMar-tu). What especially stands out in these seal inscriptions is the writing ʾEl-Amurru (dAN-Mar-tu). The two signs for deity have been regarded as representing a Phoenician plural, and read elim or elōnim; or it has been read dAn-Mar-tu and regarded as a combination of Anu and Martu. There can be little doubt but that the reading is, as stated above, El-Amurru, or 'El-Uru (see Amurru 1909, p. 158). This name appears frequently in the syllabaries of deities written ʾEl-Mer (dIlu-Me-ir); and it is another example of the prefixing of the word for god to names of deities like ʾEl-Shaddai, ʾEl ʾElyôn, Il-Tammesh, Il-Tehri, Il-Tēri, Al-Si', Al-Nashu (Amurru p. 158), also Il-Kanshan, and Il-Ashirta (Lutz EBL p. 4). The custom of actually pronouncing El “god” as a prefix to the name of deities, as the writer has indicated, was apparently West Semitic. Moreover, one needs only to consult the names of the

*See Krausz Götternamen p. 9, and Hommel’s editorial note in same, p. 56. Radau reads AN dMAR-TU, holding that MAR-TU was identified with the highest and oldest Babylonian god AN (BE 28, p. 41).*
patron deities of scribes and of individuals to see how extensively not only Uru but other West Semitic deities were worshipped in the time of the First Dynasty (see Chapter VIII).

The name of the counterpart of this deity at Babylon, namely Marduk, as well as other names of deities like Nergal, etc., who were regarded as sun-gods, considered in connection with the Aramaic form of the name 'Uru ( unrealistic), also the Talmudic word for "sunset" ( 'ūri'a), as well as other considerations, made it seem that the god Amurrū was a solar deity (Amurrū 100 ff.). However, it must be admitted that the West Semitic deity, Amurrū or Uru, regarded as the original deity from whom the others evolved, was primarily a storm-deity in the land where he was indigenous. This is determined by the syllabaries, where his name is so often equated with Adad. Transference of the deity from his original mountainous home to the fertile plain between the rivers, where the inhabitants were dependent upon agriculture, was probably responsible for the solar traits that were assumed.

Ann and Antu, the writer has suggested, contrary to the accepted opinion that they were Babylonian or originally Sumerian, had their origin among the Western Semites (see Amurrū p. 142). A number of considerations lead to this conclusion, among which are the following.

The name Anna or Ana very probably is found in the personal names of Chaldeans who made revelations at the time the traditional dynasty of Aloros ruled (see Chapter VIII); the second revelation was by Antūdošos, the third by Antūmešos etc., and the fourth by 'Antūdāphišos.

The temple of Ashur erected or restored about 2400 B. C. was built in honor of the gods Ann and Adad, the latter being a West Semitic deity; and as Assyria was not settled by Babylonians as heretofore held (see Chapter XVI), but by people from the lands lying west of the country, it seems reasonable to infer that the former was also West Semitic. Ann also figures in certain inscriptions of Assyrian kings prominently associated with Dagan, another West Semitic deity. Ann and Dagan are addressed in the prayer of Ashurbanipal (Craig Rel. Texts II 21: Rev. 2). The laws of Ann and Dagan are referred to by the Assyrian kings.

Antu is well known in place names in Amurrū. Anathoth, the
city where Jeremiah grew up, is a little distance to the north-east of Jerusalem. Bêth-Anoth (Josh. 15:59) is identified with Beit 'Anûn in the neighborhood of Bethzar. This may be the ancient shrine referred to as a city conquered by Seti I (BAR III, 114). Ramses II mentions a city on the mount of Bêth-Anoth (BAR III 356). A city in Judah bearing the same name was also conquered by Sheshonk I (BAR IV, 762). Bethany (written in Syriac Bêth 'Anî' אֵּת בֵּית on the road to Jericho from Jerusalem, as well as Bethany beyond Jordan may also have been shrines of Ann. As heretofore suggested by Professor Montgomery (see Amûrû p. 143), Ann may be found in the personal name 'Aner, written An-ram in the Samaritan Hebrew. 'Anath father of Shammâr (Josh. 3:31) may be an abbreviated name which originally contained that of the goddess.

Ann also figures in the nomenclature of the Cappadocian tablets, cf. Gimil-I-nîm (R.A VIII p. 149), Piša-I-na, and [Id]-ša-I-na (Babyloniana VI p. 191, 7:11). The latter name appears in a tablet referring to a decision rendered in the "house of the judgment of Ana," concerning some property belonging to the god. This shows that there was a temple of Ann in Cappadocia.

The worship of Antu was carried comparatively early to Egypt. The priesthood of the goddess at Thebes is already mentioned in the time of Thutmos III. Ramses II gave his favorite daughter a name which meant "daughter of Anath." Since it has not been shown that Babylonian influence had been exerted upon Egypt in the early period, it must be assumed at least that the goddess was borrowed from the people of Amûrû.

What seems to be the most important centre of Ann and Antu worship is at 'Ana and 'Anatho on the Euphrates (see Chapter XI); and it is not improbable that from this quarter it was spread throughout the adjoining lands.

Ann was carried to Erech in a very early period by the Semites; for whom the temple called E-Anna was erected. Lugal-zaggisi, Gu-dea, and Ur-Engur, regarded him as the "lord of lords." The Sumerians very probably adopted Anna as one of their deities. The goddess Antu, however, does not seem to have been introduced at Erech in the early period; Ishtar appears as the consort of Ann. It would seem also that Lulubu was another city in which the wor-
ship of these deities had been introduced. In the inscription of Annu-banini of an early period, who had erected a statue to Ishtar in the mountain of Batir, the king invokes for it the protection of the gods Anu and Antu, Enlil and Ninlil, Adad and Ishtar, Sin and Shamash, etc. Anu was also early worshipped at Kish, another Semitic centre. It is to be noted that the name of Anu-mutabil, governor of the city of Der, who probably lived about the time of the First Dynasty, is also compounded with that of the deity.

In connection with the question of the origin of the gods it must be regarded as significant that the worship of Antu was not introduced at Erech until the Greek period, and even then it does not appear in the nomenclature. Nor was the name introduced into Assyria; whereas in the broad expanse of Amurru and in Egypt we have so much evidence of it; and where it left such an indelible impression.

Anu has been regarded by scholars as being originally a sun-god whose great luminary was in the heavens, who became in the development of later theological systems the chief deity of the heavens. In Egypt the goddess is represented sitting upon a throne, with a feathered head-dress similar to the representations of Ashirta with whom she is often paired. She has a lance and a shield in her right hand and a battle-axe in the left; or she is represented as clad in a panther-skin. She is a warlike goddess and sensual; is called lady of heaven, daughter of the sun, etc. (Müller EM p. 156).

Ashir, whose name is written in cuneiform Asir, Asa-ru-un, As-usar, As-sur, and As-sur, and in the West Semitic script 𐤌𐤉𐤇 (also ṬZN) was in all probability of West Semitic origin (Amurru 138 ff.). This conclusion followed the consideration that the name did not appear in early Babylonian nomenclature and because of its prominence in the early Cappadocian tablets and in the Phoenician and Aramaic inscriptions. Further the name Ashirta appears to be the feminine of Ashir, even though Ashirta is in most cases written with ayin, while the few cases in which Ashir is found in the late Phoenician and Aramaic inscriptions the name is written with aleph. If this is correct, the original habitat of Ashir it would seem was probably the same as Ashirta.
An interesting confirmation of the assumption that the deity is West Semitic is the fact that Ashar is found in the Amorite Name Syllabary in the name la-[ku]-um-Ašša-rũ-um (UMBS XI 2 1 II: 6), and it is not found in the Akkadian. It is to be noted, however, that the deity is not found in the few known Hana tablets, or in the Harran Census. It is to be further noted that the feminine Ashirta or the Assyrian Ishtar do not figure prominently in these texts, occurring once in the names of the former, Idin-4RI, and a few times in the latter, which of course belong to the late Assyrian period. (See also Chapter X.)

Ashur, whose symbol is the solar disc, seems to have been a sungod, in Assyria. This is probably shown also by the name Aššir-Šamši "Ashir is Shamash, or "Ashir is my sun," found in the Cappadocian tablets, and yet like Amurru he is also a mountain-god, cf. 4Aš-šur ḫu ṣi-rų a-ši-iḫ E-ḫar-sag-kur-kur-ra "Ashur the exalted god who dwells in 'the temple of the mountain of the world'" (KTA 3, Rev. 23), and also Ašur sadu rabu "Ashur, the great mountain" (CT 26, 1: 11). His warlike attributes, which are pictured also in his emblem of the solar disc by the representation of a warrior with an arrow, are well set forth in the passage "Ashur the good one, strong warrior, mighty in battle, who burns up the enemy, thunders amongst his foes, who bursts forth like a flame of fire, who decides the battle, and like the snare or certain death is the onset of his arms" (AJS 28 p. 186).

Ashirta offers the most complicated and intricate of all problems in connection with the names of West Semitic deities, the reason being that her worship was spread throughout the Semitic world; that in certain lands her sex was changed; and that her name appears in so many different forms. In inscriptions coming from Amurru her name appears in the name Abdi-Aširta in the Amarna letters, A-ši-ir-ta and Aš-ra-tum(li, ta); in the Moabite inscription it is written ʾštrt; and in the Phoenician inscriptions ʾštrḥ, ʾštrt, also ʾšrḥ and ʾstr (late). In one of the letters of Ashirti-washur found at Taʾanach, belonging to the Amarna period, the oracle of Ashirat is referred to.5 We learn that "Solomon went after

5 See Hrozný Taʾannek No. 1:21. Since the name of the deity of this
Ashtoreth, the goddess of the Zidonians” (1 Kgs. 11: 5). In the peace treaty of Ramses II with the Hittites, Ashtart is looked upon as a goddess of that land. The deity also figures prominently in the West Semitic names of the Cappadocian tablets.

Ashtaroth was the city of Og, king of Bashan (Dent. 1: 14; Josh. 9: 10, etc.) Ashtaroth-Karnaim is mentioned in Gilead, as the place of Chedorlammer’s defeat of the Rephaim (Gen. 14: 5). Beeshtarah, the Levitical city in Manasseh (Josh. 21: 27) is regarded as Bēth ‘Ashtera “Temple of Ashtera,” and is thought to be identical with Ashtaroth of 1 Ch. 6: 71. Thutmose III refers to a Palestinian city ‘Ašṭiratu (Müller AE 162, 313). *Aš-tar-te* is also mentioned in the Amarna tablets.

In Jerome’s Onomasticon, two forts bear this name, which are nine miles apart, lying between Adara and Abila. Ashtaroth the city of Og is placed six miles from Adara. Karnaim Ashtaroth, apparently the same as Ashtaroth-Karnaim, is said to be a town lying in the angle formed by the Nahr er-Raqqad and the Yarmuk, which apparently is represented to-day by Tell ‘Ashtarā about two miles south-east of El Merkez where the governor of the Haurān resides. Ashtaroth-Karnaim is also placed by some at Tell Ashary, a site about five miles south of Tell ‘Ashara.

The worship of Ashirta was early introduced into Babylonia by the Semites who migrated there. The earliest name known to the writer that is compounded with it, is *En-bi-Aš-tar*, a pre-Sargonic ruler of Kish. The name in time was pronounced Ishtar in Babylonia and Assyria, although occasionally such West Semitic forms as *Aš-tar-tu* (time of Esarhaddon) are found. In the early Babylonian inscription of Ann-bânîni of Luhbu, Ishtar (*dRI*) appears as the consort of *dIM*. An inscription of Lugal-tar-si is dedicated to Ann and to *dNinni* which is a Sumerian name of Ishtar. As the consort of Marduk her name appears as Šarpanitum. She is also the consort of Ashur in Assyria, and of other gods, the explanation being that the name Ishtar in many instances had become the generic name for “goddess.” She was also regarded as the daughter

Amorite is written phonetically *A-ši-rat*, it scarcely seems proper to read the ideogram *dRI* in this name Ishtar, as has been done; and especially as we have no justification for this reading in any West Semitic inscription.
of Sin and Anu. (See Jastrow *RBB.A* 105 ff.). A Babylonian
hymn, rewritten in the Greek period, informs us that in her
original home, where her name was Ashrat, and regarded as "the
goddess of the plain," she was the consort of Amurru (*Mar-Tu-e*),
"lord of the mountain" (*SBII*, 139: 143-5).

A study of the epithets of the Babylonian Ishtar shows that she
is credited with playing the rôle of most of the gods, besides being
the mother goddess, the goddess of wedlock and maternity. She
is regarded as being a storm and a war goddess; as the giver of
vegetation; she presides over rivers, canals, flocks, etc. She is
identified with other goddesses, and in consequence partakes of
their attributes, or those of their consorts. Like Aphrodite, in
some parts of Babylonia, she was also recognized as a dissolute
goddess, and prostitution was practiced in her name. The pas-

gage Deut. 23: 18 together with other evidences would seem to show
that these immoral rites had been introduced from the West.

The worship of Ashirta or 'Astarte was carried to Egypt where
she was worshipped in the city Ramses and elsewhere. Her chief
temple was at Memphis. In Egypt she was known as the goddess
of war, of horses and the chariot. Anath and Astarte were "the
shields" of Ramses III (*BAR IV*: 105). Qedesh, perhaps another
manifestation of 'Astarte, is pictured as a nude goddess standing
on a lion, holding flowers in one hand and a serpent in the other,
and wearing the sun and moon on her head. 'Asit, who always
rides on horseback, may be another form of Astarte (Müller *EM*
p. 156).

In Arabia the deity Athtar, regarded as the same as Ishtar, was
recognized as masculine. Some scholars maintain that 'Attar or
'Ahtar (אתר) who appears late in Aram, is a modification; although
this is by no means certain. On the Moabite stone (ninth century)
'Ashtar is identified with Chemosh, and is also regarded by
scholars as masculine.

Many scholars hold that the original home of the goddess was in
Babylonia. Barton and others regard it as fairly well established
that Ishtar was a universal Semitic deity, but that Arabia is its
home. While it is one of those questions that cannot be deter-
mined, and every one is entitled to his or her view, there is little
question in the mind of the writer in the light of the above, that
this goddess emanated from Amurru; and very probably from Ḫalab or Aleppo (see Chapter XII).

Barton finds the origin of the name in the root 'tara, as a term connected with irrigation. Paton follows him and suggests that it applied to the numen of the spring and meant "self waterer."6 There may be reasons based on the attributes of the god Athtar for this conception, but scarcely on those of Ashtaroth-Ishtar.

There is no way of determining whether the view that Ashirta is the feminine of Ashir is correct, but it appears perfectly reasonable in spite of all the objections that have been raised. Metathesis could have taken place and Ashirta or Ashrat became Ashtar. Subsequently when the etymology had been lost sight of, the feminine ending could have been added, when Ashtar became Ashtarta. The place name Anathoth of the Old Testament would seem also to contain a double feminine ending. Such forms as qinnatâte, feminine plural of qinnu "family," which occur in the Babylonian contract literature, must be explained in the same way.

Atā or Attā was a West Semitic deity frequently found in the Aramaic inscriptions. It is found in a name in the Harran Census, A-ta-id-ri, and in A-ta-su-ri, Sa-ku-a-ta-a, etc., also in the Assyrian period. (See Tallqvist APN.)

Attar or Atar, the deity of the Aramaeans, as mentioned above, is regarded by some scholars as identical with the Arabian Athtar and the Biblical Ashtart. In the Assyrian documents it is represented in the names A-tar-bi-'-dī, -kam-mu, -idri, -qāmu, -suri, (= אשת), Bir-A-tar, tdA-tar-ma-la-aḫu, and in the Babylonian documents td.A-tar-nāri, A-tar-idri, A-tar-ri-El, etc. This deity's name, as is well known, is combined with Ate in the syncretistic name Atargatis (אתגרת), the chief goddess of the Aramaeans, whose worship existed in the late period throughout Syria.

Dagan, whose name is written Da-gan, Da-ga-an (Amarna 317: 2), Da-gan-na, and Da-gu-na (Bezold Catalogue IV 1482), was worshipped in different parts of Amurru, but his original home seems to have been in the middle Mesopotamian region. As mentioned above, Chapter IX, about a dozen names in the few tablets discovered as coming from the kingdom of Ḥana are compounded

6 See article "Ishtar," Hastings Encyclopaedia of Religion and Ethics.
with that of Dagan, and a number bear the title "priest of Dagan." In Tirqa, probably the chief city of Hana, Dagan was apparently the patron god. Shamshi-Adad, "king of Assyria, king of the universe," restored the temple of Dagan, and recorded himself as a worshipper of that god. The oath formulae of the contracts from that region show that the people swore by Shamash, Dagan, and Itur-Mer. The property recorded in one of the deeds is said to be that of these three deities (see Chapter XI).

In Canaan the deity was worshipped by the Philistines at Gaza (Judg. 16: 23), and at Ashdod (1 Sam. 5: 1). There was also a temple of Dagan near Joppa, which was probably Bêth-Dagon (Josh. 15: 41). This fane and its surroundings are represented by the present site Beit Dejan, about six miles south-east of that city. There is another Beit Dejan about six miles south-east of Nablus; and Josephus mentions a fortress above Jericho called Dagon (Ant. XII 8: 1). One of the writers of the Amarna tablets was a certain Dagan-takala. The personal name I-ti-Da-gan occurs in a tablet from Cappadocia (Babyloniaca 1907 p. 19).

Dagan was carried to Babylonia by the Semites at an early period. The first appearance in Babylonian literature is in personal names of the time of Manishtusu. In the obelisk of that ruler several names are compounded with the name of the deity. Dungi, in his thirty-seventh year, dedicated a temple to Dagan. Two names of rulers of the Nisin Dynasty, which was founded by an Amorite from Mari, are compounded with the god's name; namely, Idin-Dagan and Ishme-Dagan. Hammurabi in his Code calls himself the warrior of Dagan. More than one early king of Assyria also bore the name Ishme-Dagan. Ashur-naṣir-pal (883-859 B. C.), Shamshi-Adad (823-811 B. C.), and other Assyrian kings claimed to be devotees of Anu and Dagan.

There seems to be considerable difference of opinion concerning the nature of the god Dagan or Dagon. Since Dagan is equated with Enlil (CT 24 6: 22 etc.), it seems reasonable to regard him as possessing similar attributes.

Ea, as Chiera has proposed, is probably a West Semitic deity

7 For a full discussion on his nature, see Paton "Dagon" in the Encyclopaedia of Religion and Ethics.
(UMBS XI 139 f.). In the name syllabaries which he published, he finds Amu, Ea, and d'IM grouped together, and also Dagan, Ea, and Ishtar. In the Amorite syllabary he found El, Ea, and Ishtar grouped together. If his contention should prove correct, then very probably the three gods of the triad, Amu, Enlil, and Ea are Amorite.

In the Cassite period the deity Ea-sharru occurs in personal names, as: Eri-ba-dE-a-sarri, Ib-ni-dE-a-sarri, Núr-E-a-sarri, etc. This deity was worshipped at Calah, in which city Ashur-našir-pal established an image of him. In the Amarna letters sent from Mitanni, Ea-sharru figures in two lists of deities: in one, Teshub, Shaushka, Amon, Shimike, and Ea-sharri; and in the other, Shimike, Amon, and Ea-sharri. Are we to see another syncretistic formation in this name? Shar, written Shar, Shar-ri, LUGAL, and III in Hittite names, occurs frequently, as Ḥa-at-tu-Shar, Ah-li-ib-Shar-ri, It-li-ib-Shar, etc. (see Clay PN p. 33). One feels inclined to inquire at least whether Shar was Semitic or Hittite (see under Shar below).

En-lil, whose name was written with two Sumerian ideograms, En "lord" and Lil "the storm," is considered by most scholars to be of Sumerian origin. The chief proof besides the Sumerian form of his name is found in Reissner SBH 13: 1-7, where what are called Enlil's seven chief names are found. They are: Lord of the lands; Lord of the living command, Divine Enlil; Father of Sumer; Shepherd of the dark-headed people; Hero, who seest by thine own power; Strong lord, directing mankind; and Hero, who causest multitudes to repose in peace (see Jastrow RBBA p. 70). The argument for the Sumerian origin of this deity based upon this evidence can by no means be said to be conclusive. As the Babylonians adopted Adad and other deities, it is reasonable to suppose that the "black-headed" Sumerians may have adopted this deity. Further, the fact that his name is written in Sumerian is no more proof of its origin than that Ashratu, the consort of Amurrum, was Sumerian, whose name was written Nin-gú-edin-na (Eme-sal: Gásan-gú-edin-na), "the lady of the plain."

Originally Enlil was a storm deity, as his name implies. He was a god of the mountain. His temple was called E-kur, which means "house of the mountain." His consort was designated Nin-šar-
**XVII. THE DEITIES OF AMURRU.**

sag, "lady of the mountain." He is called Shadu-rabû "great mountain." When transferred to the alluvial plain Babylonia, where agriculture was extensively practiced, and which so greatly depended upon the winter rains, Enlil becomes a god of fertility or an agricultural deity. Primarily, however, he is a veritable Adad, for "he causes the heavens to tremble and the earth to quake." Moreover in the Sumerian hymn above referred to, there is no indication of his original qualities, but the epithets reflect only a broader and more general character than had been assigned him in later times.

Although Enlil was the chief patron deity of Nippur, in the Name Syllabaries of the time of the First Dynasty found in that city, his name occurs only twice, unless it is assumed, with Chiera (UMBS XI 38 ff.), that it is represented by the ideogram LEASE. Instead of the later triad, Anu, Enlil, and Ea, there appears in the Semitic lists, the triad, Anu, Ea, and LEASE. As stated above, the attributes of the deity LEASE are identical with those of Enlil, the god of the storm and atmospheric conditions.

Gir was the name of a deity in the land of Amurrû as well as the name of a country (see Chapter III). In the West Semitic inscriptions a number of names are compounded with the deity, as Gir-milki (גיר-מלך, etc. See Cook North Semitic Inscriptions), which would show that his worship was continued up to a late period. But we are dependent largely upon evidence from Babylonian sources for the existence of this Amorite god. "Gir ša birqi "Gir of the lightning," ša šadi "of the mountains" is also identified with Kur-Gal (=Amurrû), Mar-tu (=Amurrû), and SAR-SAR (see CT 24 89-94). Gir is also identified with Nergal an importation from the West (CT 25 50: 15). The sign is also found in the ideographic writing of his name. LEASE-LEASE-u=LEASE (CT 25 17: 31). Sar-ra-pu=Sar-gir-ra Marki i.e. Shar-Girra of Amurrû (CT 25 35: 24) is another syncretistic formation. Line 26 of the same text reads Sar-Gir-ra-Swki. The element appears in the name Nin-Gir-Zu (or Su) also written Nin-Zu-Gir, the deity of Tello, who is identified with the West Semitic In-Urta. In this connection it is natural to think also of the deity En-Gur, in the name of the founder of the Ur Dynasty, since the change from Gar to Gor (written Gur) offers no difficulty. The comparison is at
least inviting because of other rulers of this dynasty bearing Semitic names. Even Dun-qi is not the pronunciation of the second ruler’s name as shown by the complement ra in the Sumerian name șDun-Gi-ra-kalam-wa, and perhaps others. It is not improbable that these Sumerian forms represent Semitic names. Since the phonetic change of g into m is well established in Sumerian, the latter being the Eme-sal for the former, and as so many cuneiform signs beginning with m also appear with g, the question arises whether it may not be possible that Gir and Mar are dialectically connected even in names found in the West.

It is to be noted also that GIR has the reading Su-mu qa-an, Su-mu-ug-ga, and Sa-kan (CT 29 46: 8, 9); also Ša-kan (CT 12 31). This may be found in the West Semitic name Gir-sakan (ג"ר), perhaps a name formation like Gir-Ba’al (ג"ל) and Gir-Ashteroth (ג"ר). Note also the formula GIR = dumu šu-mu-qa-an GIR, CT 24 32: 112.

Hani occurs in several names found on Babylonian tablets, cf. UR-ša-ni, Gal-ša-ni, etc., of the Ur Dynasty; šša-ni-ra-bi and Awil-ša-ni of the First Dynasty; and šša-ni-be-el-gaš-ši of the Cassite period, etc. In the Ḥarran Census the names Ḥa-an-da-di, Ḥa-an-su-ri, and Bir-Ḥa-a-nu occur, which would seem to associate the deity with that part of the region.

Hani bears the title be-lum ku-nu-uk “lord of the seal” (SBH 50: 8); and also is called ilu ša ṭupšarrūti “the god of the scribes” (Shurpu II: 175). He together with Nisaba his consort are credited with being the givers of the most ancient laws now known (see Chapter XI).

Lahmu and Laḥamm. The only trace of the worship of Lahmu in the West is in the well known place name Bēth-Lehem in Judah, and also in Zelampaign, now represented by Bēt Lahm, about seven miles north-west of Nazareth. These deities figure prominently in the Marduk-Tiamat creation legend, which as previously shown also emanated from the West (see Amurru 44 ff.). The names of the deities do not seem to have been used in the composition of names by the Babylonians and Assyrians. In fact besides the creation legend adopted by the Assyrians, in which the names occur, they are only found in late Syllabaries, where they are des-
ignated as god and goddess (anum and antum); see Deimel Pantheon Babylonicum p. 162.

Marduk has been regarded as being the contracted pronunciation of a syncretized name Amar-Utug, combining the West Semitic god Amar or Amur with Utug. The basis for this assumption is the formula \textit{Amar-Utug} = \textit{dA-ma-ru} (B. 11566), the personal name \textit{U-ri-Marduk} of the Cassite period (Clay \textit{PN}), together with the fact that the Marduk-Tiamat myth is West Semitic. If the name Marduk originated in Babylon in this way it should not be found in the West, except through influence from Babylonia. The fact is there is an almost complete absence of the use of the name in the West, in spite of the claims of the Pan-Babylonists that the Canaanitic civilization was imported from Babylonia.

Marduk was the local god of Babylon. As the city is scarcely mentioned in the inscriptions prior to the First Dynasty, neither is the name of Marduk. Even in the Name Syllabaries of that period it does not occur. But with the ascendancy of Babylon under Hammurabi he became the chief god of the pantheon, when he supplanted all other gods. The nomenclature thereafter of all the Babylonian cities showed the extensive influence of his worship. And as is known, Babylon continued to be the centre of the hegemony established by Hammurabi for nearly two thousand years.

Mash was the name of a deity in Amurru as well as the name of a country and a mountain. There was also a city named \textit{Ki-Mash} “place of Mash” (see Chapter XII). Although the god has not been heretofore recognized in the West, it would seem that his name is probably compounded in that of a hero in David’s time, Mash-mannah (1 Chron. 12: 10); in Mish-‘am ( множественное число), a name in Benjamin (1 Chron. 8: 12); and in the gentilic name Mishraites ( множественное число. 1 Chron. 2: 53). In \textit{Amurru} it was conjectured that perhaps in the absence of any etymological explanation of Shamash, it may have been from \textit{Sa Mash} “(the god) of Mash,” like the Arabic Dhū’l Sharā etc., in other words that the mountain Mashu was his habitat (see \textit{Amurru} p. 127).

The consort of Mash was Mashtu. They are called the children of the god Sin (\textit{Amurru} p. 200). Mash is also a name of the god \textit{dNin-IB}; the sign MASH is used interchangeably with \textit{dNin-IB}. 
The Aramaic equivalent, נבשה, for the name, found on the business documents of Murashu Sons seemed to point to the reading En-Mashtu as the god's name. En-Ushtu is also possible, which could be from En-Urta or In-Urta.

It was also contended in Amurrut (p. 78, and MI 1 ff.) that the deity Mash was carried by the Semites to Babylonia at a very early time. In the first three dynasties, Kesh, Erech, and Ur, names compounded with the deity Mash or Mesh predominate. Especially at Erech in the early period do we find evidence of the worship of this deity. Some have translated this element as meaning "hero," as for example the name Meš-ki-ag-nun-na is said to mean "the hero the beloved of the highest." Rather does it mean "Mesh is the beloved of the great one," or "Mesh is the great beloved." Names setting forth the hero character of individuals were not given at birth; and we have no reason for believing that they are titles. (See the discussion on the name Gilgamesh Chapter VIII.) The early passage, reading g alla 4Meš sandu Unu(g)ki-ga "man of the god Mesh, the priest of Erech" (BE 2 87 1: 30); the early seal reading Nin-Unugki en Meš ê Unugki "Nin-Uruk, high priest of the god Mesh, in the temple of Erech" (Collection de Clercq 83), the personal names Ur-Mesh dumu Lu-Unugki "Ur-Mesh, son of Awil-Uruk (RA VIII p. 31), show conclusively that a deity Mesh was worshipped in Erech (see Mise. Insc. p. 3).

The character of the deity may probably be inferred from the syncretistic formation Uru-asr ma-aš Maš (CT 24 10: 8); in other words that Mash was a deity similar to the mountain or storm-deity Uru. The association of the god with the mountain Mashu, as above, would seem to support this view. This is confirmed in another way. The god Nergal is a transformed Uru from the West. Another name of Nergal is Mesh-Lam-Ta-e "Mesh sends forth the sprout," and this deity is from Amurrut (see below under Nergal). Mash, Mesh, and Mish are also elements that figure prominently in the temple names of Nineveh, Cutha, and Akkad.

Nabû is also regarded by the writer as being of West Semitic origin (Amurrut p. 144). The fact that his name figures prominently in the nomenclature of West Semitic peoples; and that there was a city Nebo in Moab (Numb. 32: 3, 38), probably near Mt. Nebo, the place of Moses' death (Numb. 33: 47), as well as a
city in Judah by that name (Ezr. 2: 29), make it appear highly probable that the original home of the deity was in Amurru. What is especially confirmatory of this conjecture is the fact that in the Akkadian Name Syllabary from Nippur of the period of Hammurabi the name does not appear; but in the Amorite Syllabary the name I-zi-Na-bu-u is found. Owing to the great ingress of Amorites in this period some names are compounded with that of Nabû. The deity also received recognition on the part of the kings. In Hammurabi’s reign, “Ezida the beloved temple of Nabû” is cared for. The date for his sixteenth year reads: “The year in which the throne of Nabû was built.” See also the twenty-seventh year of Ammi-ditana (LIH III 193, 235, and 250). Earlier than this, we have no knowledge that the deity was recognized. At any time, however, the antiquity of his shrine may be shown to be much greater.

Nashšu or Nashuš is a deity found frequently in names of the Harran Census, as Nashšu-gabri, etc. This form occurs rarely outside of these tablets (see Tallqvist APN).

In the inscriptions of Ashurbanipal the fire-god Nusku is frequently referred to. This king restored his temple, E-melam-anna in Harran. From his texts also we learn that he is closely related to Sin, Girru, In-Urta, and Nergal.” These are West Semitic gods. His consort’s name is Sadarmunna. In publishing the tablets of the Harran Census, Johns proposed that Nusku was very likely a Syrian god originally, and that his name in the Census appears Nashšu. This being correct Nashšu doubtless more correctly represents the actual pronunciation of his name in his original habitat. At an early date the worship of this West Semitic deity was introduced at Nippur, where his name was written Nusku.

Nergal is another name which like Marduk is a contracted pronunciation of the ideographic writing Ne-Uru-Gal; and was also an importation from the West (Amurru 114 ff.). Other names of this deity are Sar-Girra, Meš-Lam-Ta-e, etc. These two gods are said to have come from Marši (Amurru, or Mari), and from Sulši, which is a district in Mesopotamia (CT 25 35: 24-26). The name Meš-Lam-Ta-e probably means “the god Mesh sends forth fruit

(or the sprout).’’ The habitat of Mesh or Mash, who is thus regarded as identical with Nergal, as noted above, is the mountain Mash. Like the contracted pronunciation Marduk, which also arose in Babylonia, the form Nergal was not used in the West prior to the exile, with one exception, which occurs on a seal found at Ta’anach; the inscription of which reads: A-ta-na-ab-ili (NI-NI) apil Ha-ab-ši-im arad Ne-Uru-Gal ‘‘Atanah-ili, son of Habsim, servant of Nergal.’’ The seal was unquestionably of Western origin, but the script is Babylonian.

Whether the ideogram Ne-Uru-Gal was read or pronounced Nergal in this instance, or whether it was simply employed to represent the name of some god worshipped in Palestine, perhaps Gir, Mash, Uru, etc., cannot be determined. It should be emphasized that this is the only known use of the name in the early period, when according to the Pan-Babylonists the civilization of Palestine is supposed to be essentially Babylonian.

Resheph ‘‘lightning,’’ ‘‘flame,’’ the lord of heaven, lord of eternity and ruler of the gods, the warrior, is well known from the late Aramaic inscriptions of northern Syria. As far as known to the writer, this deity is not mentioned in the cuneiform inscriptions. He figures, however, in Egypt, where he is depicted wearing a high conical cap, to which often is tied a long ribbon falling over his back, and which is ornamented with the head of a gazelle. He carries a shield, spear, club, and sometimes a quiver on his back. In one inscription he is called Reshpu-Saramana, a syncretistic form which may mean that he is identified with the god Shalman. Together with Min (a harvest deity) and Qedesh, Resheph forms a triad in Egypt (see Müller EM p. 155).

Shamash, in the Amarna letters, is looked upon as the leading deity of the Amorites. It may be due to the fact that the chief deity of Egypt, Amon-Re, was solar, that he occupied such a prominent place in the salutations of the Amorite princes to the Pharaoh, in which he is called ‘‘my Shamash, my god, my lord.’’

The place name Bēth-Shemesh near Gaza, perhaps the personal name Shimshôn (Samson), as well as names found in the Cappadocian tablets, show how widespread was his worship. An important centre of Shamash worship was found in the Mesopotamian district, where he was the foremost of the triad who were invoked in
the oath formulae of the Ḥana contracts: Shamash, Dagan, and Itur-Mer (see Chapter XI). At an early period the Semites carried his worship into Babylonia, where in the cities Sippar and Larsa he became the patron deity. He is perhaps the best known god in the Babylonian and Assyrian pantheons.

The deity Shamash was early carried to Arabia, and looked upon as a goddess. Winckler held the view that the deity was considered feminine also in early Hittite groups. As mentioned above, the name found in the Nippur Name Syllabary, Tu-li-id-Sam-ši(-ši), shows that the deity here was construed as feminine. (See also under Mash.)

Sharu. There is a god Sharu that has figured very prominently among the Semites in Amurru and Babylonia, as well as in other lands. An important centre of his worship was at Umma, in Babylonia, at present called Jokha. His name in this region was written with the ideogram lagab with igi-gunu inserted, the correct reading for which, namely Shara, is made known by the Yale Syllabary (MI 53:111). As in the case of the god Uru or Amurru (see Chapter VII), other signs having values pronounced like Shara, Sharru, etc., without regard for the meaning of the signs, were also employed by the scribes to reproduce the pronunciation of the name, as:

\[ \text{IM meaning "wind"; BARA meaning "shrine"; MARUN meaning "court, fold, sheep,"}^{10} \text{ HI meaning "mass, totality"; LUGAL meaning "king"; AGAR meaning "field," SIAR meaning "vegetable growth"; etc., all these signs having values pronounced like Shar, Shara, Sharru, were used by the scribes to reproduce the sound of the deity’s name, who had been introduced in Babylonia from the West. With this practice of the ancient scribes, Langdon by his criticism and assertions apparently does not seem to be acquainted (RA 13 p. 161).}

9 See Mitteilungen der deutschen Orient-Gesellschaft No. 35 p. 53.
10 MARUN = šara Yale Syllabary No. 112. HI: AGAR = šara, ibid. No. 111.
The name is also written phonetically Sha-ra, Sha-a-ru, Shar-ru, Shar-ra, Shar-ri, etc. Perhaps also Sheru, or Sher\textsuperscript{11} is to be included as represented in West Semitic names, as Șe-ir-id-ri, Șer-ila-a-a, etc. (see Tallqvist \textit{APN}); and probably also Dûl Sharâ, the god of the Nabataeans.

It is not impossible that many of the names of deities composed of \textit{LUGAL} and other elements are Semitic in a Sumerian dress; and that this ideogram is to be read Shara, like ʾE-a-a-šar-ri of the Amarna letters, which is usually written ʾE-a-LUGAL (see under \textit{Ea}).

Sharu appears especially in names of the early Babylonian periods, see Sár-ru-ba-ni, Sár-ru-tâb, etc., and probably in the names Șar-ga-ni-Șâr-ri and Bi-in-ga-ni-Șâr-ri (\textit{BA} VI 3 85 ff.). In the Ur Dynasty many names are compounded with the deity. For other compounds in which Shar appears as an element in names of temples and deities, see the writer’s \textit{Misc. Inscr.} p. 15.

A large number of personal names among the Hittite-Mitannian are constituted with a god Shar, cf. Ḥa-at-tu-Šar, Ah-li-ib-Šar-ri, It-hi-ib-Šar, etc. (see Clay \textit{PN}). Note also the names with Shara, which are probably from the same source, which have been collected by Sundwall \textit{Klio} 1913, Elftes Beiheft 190 ff. Naturally the question arises whether this deity is the same; and if so with which people, the Semitic or Hittite, did his worship originate. If they have a common origin, it seems probable that the Hittites may have borrowed the deity from the Semites; as is clearly evident they did in several other instances.

The Syllabaries associate the god Shara with Adad, Gir, Mur, Ilu-Mer, Nergal, In-Urta, etc., which shows that he was regarded as similar in character. This would seem to indicate that he was a solar or storm-god. The idea that he was “a vegetation god” or “the god of flocks,” which Langdon has proposed (\textit{RA} 13, 161), seems to be justified alone by the employment of two of the signs used to reproduce the pronunciation of his name (see above). To differentiate between deities as being solar-gods, vegetation-gods or storm-gods is more or less artificial, since vegetation is depen-

\textsuperscript{11} Cf. \textit{šer} = \textit{etillu} (B. 4306), a meaning the sign received perhaps like the Aramaic \textit{Mar} “lord” from the name of the deity \textit{Mar}. 
dent upon the sun and the rains. Moreover, solar-deities are also vegetation-gods.

Sin was the chief deity of Harran, whence apparently his worship emanated at an early time. The Assyrian scribes who made the Harran Census in the seventh century wrote the name Si-\(^\text{1}\), showing that they heard a pronunciation of the name in that district which was different from that of their own god Sin. (See Chapter XIV.) If the eighth name of Berossus's antediluvian kings, \(\Lambda\nu\varphi\varphi\nu\varsigma\), is correctly understood to represent Amēl-Sin, it is the earliest reference to the name known. Semites brought the worship of Sin into Babylonia in an early period. The geographical names Wilderness of Sin and Mt. Sinai show the influence of the deity in the country south of Palestine. His worship was carried as far south into Arabia as Hadramoth (see Chapter II).\(^\text{12}\)

Zababa is a deity in the cuneiform literature whose name has been read Za-mā-mā, Za-mal-mal, and Za-ga-ga. He is known as the patron deity of Kish, an early Semitic city in Babylonia. This deity has been identified with Inurta (\(^4\)Nin-IB), called mār réstum ūa Ekur "the first son of Ekur" in the Hammurabi Code; and is later regarded as "the Marduk of battle."

The writer has shown from the recently published Chicago Syllabary (see JAOS 37 328 f.) that Mā in the name was read bā, thus Za-bā-bā; and noted that this pronunciation approaches the name of the god Ekron, namely Baʿal Zebub. It was also suggested that perhaps later we would find more evidence of a deity in Western Asia named Zabûb or Zabab, whose name was reproduced in cuneiform Za-ba-ba. Subsequently it was found that this had already been anticipated by Winckler (MVAG 18 4 p. 70 f.) in his advanced notices of the new cuneiform material found at the Hittite centre Boghaz-köi. In it, he called attention to the prominent rôle Za-ba-ba (which he read Za-ga-ga) played among the Hittites and allied peoples, whom he seemed to think was as prominently worshipped as Teshup. He had a temple in the capital and probably was the chief deity of Ellaia and Arzia which is inferred from the part his name played in the great political treaties. The existence of the cult of Zababa among these peoples, Winckler held,

\(^{12}\) Note also the passage "field of Sin the god of Halaba," VS VII 95:4.
was due to colonization or migration from Babylonia at a time when Zababa had the same high position that Marduk later had. If this statement could be supported by evidence of the influence of the Marduk cult in the West it would have more force.

The disadvantage in not having any light on early Amorite, or in this instance on early Hittite, history from native sources is here again felt, in that the date of the earliest reference to the deity in Babylonian history is so much earlier than the tablets referred to. In spite of this fact, it seems to the writer that Winckler has the order reversed; and that Zababa is really a deity like Inurta with whom he is identified, who was extensively worshipped in the West; and was carried to Kish at a very early date. Further discoveries will determine whether this is correct.

The syncretistic name "Ur-Zababa (CT 24 8: 5) is to be noted. Probably Zababa was also a storm-deity; being the Marduk of battle and the foremost son of Ekur (see above) would accord with this idea.

Another discovery which has recently become known may prove that the name is to be read Il-ba-ba instead of Zababa. Langdon has kindly informed the writer that the equation il-ba-ba = MA-MA = MA occurs on a Berlin text, which is published in a Fest-schrift dedicated to Hommel. This suggests the equation Il-Ba = MA (CT 25, 27: 6) for comparison. Moreover, in spite of Luckenbill's contention (AJSL 35 59 f.), the writer's proposed reading of MA = ba, in the name seems thus to be confirmed.

It is of course apparent that the trend of what precedes is toward regarding practically everything that is Semitic Babylonian as having its origin in Amurru. It seems with the collapse of the Arabian origin theory of this culture (see Chapter II) in the light of what has been offered, and also what might be assembled, that no other conclusion is possible. As set forth in the introduction, Semites from Amurru entered the valley at a very early period. Under foreign influences in the new surroundings the old culture developed differently, and when in a later period a new emigration or invasion took place, what had been in the "melting pot" for a millennium, which we call Akkadian, though still Semitic, was strikingly different. This evolutionary process needs no explanation for history shows it has gone on in all ages, and is going on at present, and will continue to go as long as the world lasts.
